1.0 DECLARATION

Site Name and Location

Former Norton Air Force Base (AFB), San Bernardino, California (Figure 1-1)
U.S. Environmental Protection Agency (EPA) identification: CA4570024345.

Statement of Basis and Purpose

This Basewide Operable Unit (OU) Record of Decision (ROD) presents the selected remedies for 21 of the 22 Installation Restoration Program (IRP) sites, all of the 73 Areas of Concern (AOCs), the small arms range (SAR), Building 752, and groundwater contamination in the Northeast Base Area (NBA), former Norton AFB, San Bernardino County, California (see Figures 1-1 and 1-2). The selected remedies presented in this ROD were chosen in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended by the Superfund Amendments and Reauthorization Act (SARA), and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). The remedial decisions are based on the findings of the *Basewide Feasibility Study* (BWFS) (CDM Federal Programs Corporation [CDM], 2003) and other associated documentation included in the Norton AFB Administrative Record. The Administrative Record index is provided in Appendix A. The Air Force and the U.S. EPA are selecting these remedies with the concurrence of the State of California, including the Department of Toxic Substances Control (DTSC) and the Regional Water Quality Control Board (RWQCB).

This ROD addresses remedies for the IRP sites, but does not complete Resource Conservation and Recovery Act (RCRA) corrective action termination. Sites 7 and 17 and AOCs 33 and 70 are addressed herein, and corrective action termination will be addressed separately under RCRA. Groundwater contamination (i.e., the Norton tricloroethylene [TCE] plume) was addressed in the Central Base Area (CBA) OU ROD (U.S. Air Force [USAF], 1993a), which included soil sources that contributed to the plume, as well as Site 9, and is not part of this ROD. The Basewide OU ROD will not further discuss the sites addressed in the CBA OU ROD.

THIS PAGE INTENTIONALY LEFT BLANK

Assessment of the Sites

The response actions selected in this ROD are necessary to protect human health and welfare or the environment from actual or threatened releases of hazardous substances and pollutants or contaminants as defined in NCP Section 300.5.

Description of Selected Remedies

This ROD addresses remedies for IRP sites but does not complete corrective action termination of the RCRA sites that are part of the RCRA interim status facility. The Basewide ROD-selected remedies are designed to protect human health and the environment. Contaminants present in the soil and groundwater are the result of historical operations at Norton AFB, primarily activities associated with aircraft maintenance. The Basewide ROD sites and previous removal actions, preferred alternatives, and selected remedies are listed in Table 1-1. Selected remedies specified in this ROD are described below:

- No Further Action (NFA) Sites (14 IRP sites, 72 AOCs, and the NBA Tetrachloroethene [PCE] Plume)

  Contaminants were not detected at levels that pose an unacceptable risk to human health or the environment, or cleanup has been completed, and confirmation sampling results indicate that contaminants are not present at levels that constitute unacceptable risk to human health or the environment. The Air Force and the U.S. EPA, with concurrence from the State of California, have concluded that no action is necessary to protect human health or the environment. These sites allow unrestricted land use, which means that the property can be used for any type of development, including residential purposes, hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.

  Residual contamination at AOC 4 exceeds unrestricted use levels. Restrictions are included in the Federal Aviation Administration (FAA) transfer document, and in city zoning provisions. In addition, State Land Use Covenant (SLUC) regulation 22 California Code of Regulations (CCR) 67391.1(b), which has been identified as an applicable or relevant and appropriate requirement (ARAR), specifies the execution of an SLUC, which provides DTSC with an enforcement mechanism to assure compliance with the restriction on residential and sensitive uses. The Finding of Suitability to Transfer for this property was signed on September 11, 1997, and the property was transferred to the San Bernardino International Airport Authority (SBIAA) by the Air Force on April 1, 2001. The 5-year review will also ensure that the land-use controls remain effective.

Notes:
Remedies for Sites 7 and 17 and AOCs 33 and 70, are addressed in this ROD; these sites will also be addressed for the corrective action termination of the RCRA Interim Status Facility.

[1] Preferred alternative specified in the Basewide Proposed Plan (Earth Tech, 2004c).

[2] Excavation and treatment of contaminated soil from AOC 24 (Building 658) were performed as a component of the CBA OU selected remedy documented in the CBA OU ROD.

[3] Excavation and off-site disposal for Site 12 and AOC 40 were completed and closure reports were finalized in October and December 2004, respectively.

AOC = Area of Concern
CBA = Central Base Area
EPA = Environmental Protection Agency
IC = Institutional Control
IRP = Installation Restoration Program
NBA = Northeast Base Area
NFA = No Further Action
PCE = tetrachloroethene
SVE = soil vapor extraction

- Institutional Control (IC) Sites (IRP sites 2, 5, and 19 and the SAR)

  Contaminants are present in the soil at levels that do not allow for unrestricted land use. In order to protect human health and the environment, the Air Force will include land use restrictions that run with the land to prohibit activities that may result in unacceptable exposure to residual contamination or may facilitate contaminant migration.

- Removal Sites (IRP sites 7, 10, and 17; AOC 33; and Building 752)

  Soil contamination will be excavated and disposed at an approved off-site facility. Soil samples will be collected from the excavation to confirm removal of contaminants posing an adverse risk to human health or the environment. The excavation will be backfilled and compacted with clean materials, and the site will be restored to its prior condition. Excavation is an economical, permanent, and relatively swift means of removing contaminants from shallow soils.

Statutory Determinations

The selected remedies included in the Basewide ROD attain the mandates of CERCLA Section 121 and the NCP. The selected remedies protect human health and the environment, comply with federal and state requirements that are legally applicable or relevant and appropriate to the remedial action, are cost-effective, and to the extent practicable, utilize permanent solutions. The excavation remedy is a permanent solution. ICs are a permanent solution, but do not satisfy the statutory preference for treatment as a principal element of the selected remedy.

Implementation of the selected remedies will result, in some cases, in hazardous substances, pollutants, or contaminants remaining on site above levels that allow for unrestricted land use. Therefore, a statutory review will be conducted in these cases within 5 years after initiation of the remedial action to ensure that the remedies are, or will be, protective of human health and the environment.

ROD Data Certification Checklist

The following information is included in Section 2.0, the Decision Summary of this ROD.

- Contaminants of Concern (COCs) and their respective concentrations
- Baseline risk represented by the COCs
- Cleanup levels established for COCs and the basis for these levels

- Current and potential future land and groundwater use assumed by the human health risk assessment (HHRA)
- Potential future land and groundwater use available as a result of the selected remedies
- Cost estimates for selected remedies
- Criteria for remedy selection.

Additional supporting information can be found in the Administrative Record for Norton AFB, the index for which is provided in Appendix A.

THIS PAGE INTENTIONALLY LEFT BLANK

2.0 DECISION SUMMARY

This decision summary presents an overview of site characteristics for the former Norton AFB and the Basewide ROD sites, the risk analyses performed during the BWFS, the alternatives evaluated for remedial action, and the identification of the selected remedies and the associated statutory determinations.

2.1 SITE NAME, LOCATION, AND DESCRIPTION

2.1.1 History of Norton Air Force Base

The former Norton AFB property is located in the city of San Bernardino in San Bernardino County, California (see Figure 1-1). The base was commissioned in 1942 during World War II to provide aircraft maintenance support and was formally closed in 1994. The 2,105-acre base is bordered by the Santa Ana River wash to the south and light industrial and residential areas to the north, east, and west. Cities located near the base include Redlands, Rialto, Fontana, Highland, Loma Linda, Riverside, Grand Terrace, and Colton. The population of San Bernardino County is 2,099,810 based on the 2000 United States Census.

This ROD addresses remedies for IRP sites subject to the provisions of CERCLA and does not complete the corrective action termination for RCRA interim status facilities. The base was officially added to the U.S. EPA National Priorities List (NPL) on July 22, 1987 (52 Federal Register 27620), and has been assigned U.S. EPA identification CA3570024551. The U.S. EPA, California DTSC, and the U.S. Air Force signed an interagency agreement, known as the Norton AFB Federal Facility Agreement (FFA) on June 29, 1989, which governs the conduct of environmental investigation and cleanup activities. The Air Force, U.S. EPA, DTSC, and the RWQCB Santa Ana Region comprise the Base Realignment and Closure (BRAC) Cleanup Team (BCT), with the Air Force serving as lead agency.

The base has been subdivided into six separate areas for purposes of investigation and description of base activities (Figure 2-1). Since closure and redevelopment of portions of the base, many streets have been renamed.

THIS PAGE INTENTIONALLY LEFT BLANK

GENERAL AREAS OF FORMER NORTON AIR FORCE BASE
SAN BERNARDINO, CALIFORNIA

Figure 2-1

THIS PAGE INTENTIONALY LEFT BLANK

- The CBA, which reflects the western one-third of the former base, was the most developed portion of the base and included the majority of offices, warehouses, on-base housing, engineering yards, and aircraft repair facilities.

- The former Ballistic Missile Organization (BMO) complex is located south of the CBA and across Mill Street. The former BMO complex has been deeded to the Inland Valley Development Agency and a portion is occupied by the Defense Finance and Accounting Service.

- The airfield includes the runways, ramps, aircraft parking, and hangars used for aircraft repair. The airfield covers the eastern two-thirds of the former base.

- The NBA is located north of the airfield and represents the portion of the base with the oldest buildings. The original aircraft hangars and repair facilities are located within the NBA, as well as the former base Landfill No. 2.

- The Golf Course Area (GCA) is located south of the airfield and is the current site of the Palm Meadows Golf Course. Prior to construction of the golf course, the GCA was used as a landfill (IRP Site 10), liquid waste disposal (IRP Site 1), a quartermaster's salvage yard, and chemical warfare training area, among other activities.

- The former industrial waste treatment plant (IWTP) facility is located south of the GCA and was used for the treatment of liquid wastes generated as part of aircraft maintenance and repainting.

2.1.2 Physical Setting

The physical setting is summarized in the following paragraphs. Details regarding the physical setting of former Norton AFB are included in the BWFS (CDM, 2003) and other documents available in the Administrative Record/Information Repository (see Appendix A).

Topography. The natural ground surface at the former Norton AFB is generally flat with a slight gradient to the west.

Geological Setting. Former Norton AFB is located in a valley between the San Gabriel Mountains to the northwest; the San Bernardino Mountains to the north/northeast; and the Crafton Hills, the Badlands, and the Box Spring mountains to the south. The San Bernardino valley has developed into a gently sloping alluvial plain. The former base lies above more than 1,000 feet of Pleistocene and Recent age alluvium composed of granitic and gneissic detritus.

Hydrogeologic Setting. The former base is located within the Bunker Hill hydrologic basin. Three water-bearing zones (the upper, middle, and lower) and three confining members (the upper, middle, and lower) have been defined in the Bunker Hill basin and are within the uppermost 1,000 feet of unconsolidated deposits below the San Bernardino valley. Below the upper confining member is the upper aquifer, which extends to greater than 500 feet below ground surface (bgs). Below the upper aquifer are the middle and lower confining members, also low permeability zones. Both of these confining members overlie a water-bearing zone (the middle and lower zones, respectively).

The uppermost hydrogeologic unit within the Bunker Hill basin, the upper confining member and aquifer, are beneath the former base. Localized perched zones also occur above the upper confining member within the western one-third of the base. The confining layer that creates the perched zone is comprised of silt and clay soil material found between 20 and 30 feet bgs. The perched zones are not continuous and undergo seasonal drying unless recharged through surface irrigation, as is observed in the GCA. The perched confining zone does not underlie the eastern two-thirds of the base.

The upper aquifer currently extends from depths of approximately 90 to 160 feet bgs to greater than 500 feet (the lower extent of the upper aquifer at Norton AFB has not been defined). In April 2004, depth to groundwater was approximately 115 feet bgs in the western portion of the base and 160 feet bgs in the eastern portion.

The groundwater flow direction in the NBA is westerly and gradually shifts to a southerly direction at the southwest base boundary. Groundwater flow direction along the southwest base boundary varies seasonally and is affected by the production well field south of the base from which significant quantities of groundwater are extracted to meet local water supply demands during the late spring, summer, and early fall.

Surface Water. The main surface water features in the vicinity of the former base are the Santa Ana River and City Creek. The Santa Ana River forms the southern base boundary along the eastern half of the airfield and flows towards the southwest. The river typically flows during the winter, particularly following rainfall events; during the summer, the river is dry or exhibits a

very narrow flow. City Creek flows southwest toward the northern base boundary in the northeast portion of the base, and then parallels the base boundary as it flows west. Flow from City Creek eventually empties into the Santa Ana River west of the base. As a result of completion of the Seven Oaks Dam upstream of Norton AFB, the southern edge of the base is no longer within the 100-year floodplain of the Santa Ana River (U.S. Army Corps of Engineers, 1991).

Climatology. The San Bernardino valley is characterized as a semi-arid environment. The average yearly temperatures range from 49 degrees Fahrenheit (°F) to 78 °F. Temperatures in June, July, and August often exceed 100°F. December and January are the coldest months, with average highs of 65°F and 64°F, respectively, and average lows of 37°F. Norton AFB experiences occasional sub-freezing nights during the winter. Rainfall in the San Bernardino area is sparse. The rainy season occurs between November and March with an average rainfall of 16 inches per year. Prevailing winds in southern California are from the northwest. A combination of persistent marine and land air layers often creates a temperature inversion that contributes to poor air quality in this region. Prevailing winds at Norton AFB reflect regional wind patterns. Annual average wind speed from the west is 3 knots. The maximum recorded wind speed is 69 knots.

2.1.3 Sensitive Ecosystems

An ecological risk assessment, including a habitat assessment (CDM, 1998a), has been performed at Norton AFB. Sensitive habitats for the base have been mapped. The federally and/or state-listed animal species that are present on the base include the burrowing owl (state-sensitive), San Bernardino Merriam's kangaroo rat (*Dipodomys merriami* spp. *parvus*, federally listed), and the loggerhead shrike (state-sensitive, federal-candidate). The Santa Ana River woolly star (*Eriastrum densiflorum* spp. *sanctorum*), a plant species endemic to the San Bernardino area, inhabits the floodplain of the Santa Ana River. Regional habitat destruction not associated with Air Force activities has limited the habitat of this plant species; however, maintenance of the clear zone of the runways of the base allows a population of the species to thrive. The Air Force has established a Conservation Management Plan (CMP) for the woolly star and San Bernardino Merriam's kangaroo rat in support of the airfield property transfer (Earth Tech, 2001a). The Air

Force has completed its work with the United States Fish and Wildlife Service (USFWS) regarding Endangered Species Act Consultations. On August 5, 2003, the USFWS issued Norton's base disposal biological opinion (*Formal Section 7 Consultation for Disposal and Reuse of the Former Norton Air Force Base, San Bernardino County, California*), which covers all of Norton AFB except IRP Site 10 and the former BMO property. The opinion concluded: "The disposal of remaining approximately 507 acres of former Norton AFB property will not result in direct effects to the woolly star or San Bernardino kangaroo rat or its critical habitat. Indirect effects due to future development by local reuse authorities are reasonably certain to occur" (USFWS, 2003). Woolly star plants occur on CMP property and along portions of the runway on the 753-acre parcel A (i.e., the runway and taxiway areas). The 268-acre CMP was developed by the Air Force to manage listed and sensitive species on the former base. Biological opinion 1-6-95-F-6 was issued to the FAA on January 3, 1995, concluding that the San Bernardino International Airport runway improvement program would not jeopardize the woolly star, and subsequent runway projects have been resolved informally with the FAA and SBIAA. In 1996, the USFWS issued 1-6-96-F-10, concluding that remediation of the Site 2 landfill would not jeopardize the woolly star.

2.2 SITE HISTORY AND ENFORCEMENT ACTIVITIES

2.2.1 Summary of Previous Investigations

Several investigations were conducted from 1982 to date. The results of these investigations are referred to in the discussions for each IRP site or AOC to support conclusions in this ROD. The 1982 to 1988 investigations resulted in identification of 22 IRP sites (Engineering Science, 1982; Ecology and Environment, Inc., 1987, 1989). During closure of the base, additional records investigations resulted in identification of 73 AOCs (CDM, 1993a; U.S. Army Corps of Engineers, 1994). Contamination at the SAR and the pipeline excavation at Building 752 was identified during cleanup actions performed at these sites. Table 1-1 lists all of the IRP sites, the AOCs, the SAR, Building 752, and the NBA PCE plume. Their locations are shown on Figure 1-2. This ROD addresses 21 of the 22 IRP sites, all 73 AOCs, the SAR, Building 752, and the NBA PCE plume. The groundwater contamination (i.e., the Norton TCE plume) was addressed in the CBA OU ROD (USAF, 1993a), which includes soil sources that contributed to

the plume, as well as Site 9. The Basewide OU ROD does not further discuss the sites addressed in the CBA OU ROD (USAF 1993a).

2.2.2 Sites Closed by Previous Investigations

Table 2-1 summarizes the IRP sites and AOCs that were identified for NFA during the investigation phase of study at Norton AFB. These studies included the remedial investigation (RI) study, the basewide confirmation study (CS), expanded source investigation (ESI), the CS addendum No. 1, CS addendum No. 2, the ESI Addendum No. 1, and other related documents. The IRP and AOC sites identified in this table exhibited no soil contamination at levels that would prevent unrestricted land use and, therefore, required no remedial action (RA). Interim removal actions conducted at a few sites removed contamination to levels that permitted unrestricted land use. Table 2-1 identifies the site, provides a site description, and summarizes the activities conducted at the site and the conclusions reached at the end of the studies. These NFA sites are appropriate for unrestricted land use, and NFA is required to protect human health and the environment. These sites will not be addressed further in the Basewide ROD. NFA site locations are shown, along with all sites/AOCs, on Figure 1-2.

2.3 BASEWIDE FEASIBILITY STUDY

2.3.1 Human Health Risk Assessment

As part of the BWFS, the former Norton AFB IRP sites, AOCs, and groundwater were assessed for potential risk to human health and the environment. The potential risk to human health was evaluated according to the U.S. EPA's 1998 *Risk Assessment Guidance for Superfund: Volume 1 Human Health Evaluation Manual, Part D.* The conceptual site model for Norton AFB, depicting contaminant sources, release mechanisms, exposure pathways, and potential receptors, is shown graphically on Figure 2-2. The HHRA performed during the BWFS is summarized in the following subsections.

The baseline HHRA estimates what risks the sites pose if no action were taken. It provides the basis for taking action and identifies the contaminants and exposure pathways that need to be addressed by the RA. This section of the ROD summarizes the results of the baseline HHRA for

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
IRP Site 3 – Waste Pit No. 2	Site 3 was identified during the 1982 records search as a waste pit used for disposal of industrial waste and sludges from IRP Site 1 between 1957 and 1958. The records search indicated that the waste pit was located southeast of the current golf course club house. This area is currently covered by the parking lot for the golf course.	IRP investigators attempted to locate the site through the use of a GPR survey. No anomalies indicative of a waste pit were identified. IRP investigators also drilled a soil boring and collected soil gas data. No contaminants indicative of a waste pit were detected. Additional borings were drilled during the 1991-1993 RI. Chemicals indicative of a waste pit were not encountered. Additional sampling was performed during the 1994 CS involving soil gas sampling throughout the Site 3 area, but no COCs indicative of waste were observed. Based on the findings of these three investigations, the Air Force concluded that there was no release of contamination[1], and no further action is required for Site 3.	IRP Phase II Stage 2 (Ecology and Environment, Inc., 1987); IRP Stage 3 (Ecology and Environment, Inc., 1989); RI, 15 IRP Sites OU (CDM, 1993b); BW CS Results (CDM, 1995); DD to Support NFRAP Sites 3 and 4 (CDM, 1996l)
IRP Site 4 – Waste Pit No. 1	Site 4 was identified as a waste pit used for the disposal of drummed waste. This site was reported to be located south of the airfield perimeter road, beneath what is now the east end of the cement-lined golf course irrigation reservoir.	IRP investigators attempted to locate the site through the use of a GPR survey. No anomaly indicative of a drum waste burial site was identified. During the 1991-1993 RI, soil borings were drilled adjacent to the site; no waste material was encountered. During the 1994 CS, borings were drilled through the reservoir bottom in an attempt to locate buried wastes. Results from the samples collected beneath the reservoir were not indicative of a waste pit. Based on the findings of these three investigations, the Air Force concluded that there was no release of contamination, and no further action is required for Site 4.	IRP Phase II Stage 2 (Ecology and Environment, Inc., 1987); IRP Stage 3 (Ecology and Environment, Inc., 1989); RI, 15 IRP Sites OU (CDM, 1993b); BW CS Results (CDM, 1995); DD to Support NFRAP Sites 3 and 4 (CDM, 1996l)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
IRP Site 6 – Former Underground Waste Oil Tank	Site 6 was the location of six USTs used for fuel storage. It was also reported that the USTs were used for waste product storage. The tanks were removed by 1982 when the site was converted to a military vehicle service station.	Fuels were detected in soil samples collected at this site. Because Site 6 was adjacent to the Building 647 UST site, cleanup of the site was performed under the basewide UST program. Petroleum-contaminated soil was excavated from Site 6 and the adjacent Building 647 site. Soil excavation occurred to about 40 feet bgs addressing residential soil cleanup standards and the Norton AFB petroleum cleanup standards developed under the UST program. The site has been regraded to become a portion of the parking lot for the San Bernardino International Airport. The Air Force received approval from the RWQCB for the removal action. The Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, which removed the contamination[2], and no further action is required for Site 6.	Summary UST Removal Program (Bechtel, 1997a); Closure Report, Former UST B647 (Bechtel, 1996)
IRP Site 8 – PCB Spill Area	Site 8 was a 1.5-acre yard once used for storing transformers and drums containing PCB fluids. In May 1982, a spill of approximately 20 to 30 gallons of fluid resulted in excavation and removal of 600 cubic yards of soil.	The site was investigated during the IRP, and during the 1991-1993 RI. It was determined that PCBs remained above industrial soil PRGs. Site evaluation was performed under an EE/CA and documented in an AM. Removal of contaminated soil was completed in November 1996. Cleanup achieved residential soil PRGs for the site area. The Air Force concluded that all contamination in excess of PRGs was addressed by the removal action, which removed the contamination, and no further action is required for IRP Site 8.	IRP Stage 3 (Ecology and Environment, Inc., 1989); RI, 15 IRP Sites OU (CDM, 1993b); EE/CA Parcel I-3 (CDM, 1996h); AM Parcel I-3 (USAF, 1996d); Closure Report IRP Site 8, AOCs 3, 23, 37, 38, and Heating Oil Line (Bechtel, 1997c)
IRP Site 11 – Fuel Sludge Drying Beds	Site 11 was used from 1958 to the mid-1970s as a disposal site for fuel sludges taken from airplane fuel tanks. The site is located on the east base boundary east of the Site 2 landfill. There is no evidence of this area being used for waste disposal purposes, either at present or in historical aerial photographs. Apparently all sludges had been removed from the location prior to initiation of the IRP in 1982.	During the RI, soil samples were collected from soil pits to identify the presence of sludge waste. Sludge material was not observed in any of the pits, and no COCs were detected above residential PRGs. Thus, the risk assessment indicated no adverse risk for the site. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use)[3], and no further action is required for Site 11.	RI, 15 IRP Sites OU (CDM, 1993b; DD NFRAP Sites 7, 11, 15, and 18 (USAF, 1996e); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
IRP Site 12 – Waste Pit No. 3	Site 12 was identified during the 1982 records search as being a waste pit. The site was suspected to be at the eastern edge of the golf course, west of the former Small Arms Range. Chemical and construction debris were reportedly disposed and burned at the site. The specific period of use is not known, but it is suspected to be in 1959 prior to construction of the golf course.	Site 12 was investigated numerous times between 1984 and 2003. Because of its close proximity to IRP Site 10, several investigations covered both sites. During the RI investigations GPR surveys were performed and soil borings were drilled. Soil samples were collected and analyzed for metals, PAHs, PCBs, pesticides, and dioxins. Although ash material was observed in the vicinity of the suspected waste pit, no anomalies or materials indicative of a waste pit were located. Cadmium, lead, and nickel exceeded residential PRGs in samples collected from 5 feet bgs in two soil borings. Dioxins were also detected in excess of residential PRGs. Removal and disposal of metals-contaminated soil were completed in March 2004. The Air Force concluded that all contamination in excess of residential PRGs was addressed in the removal action completed in 2004, which removed the contamination, and no further action is required at Site 12. Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
IRP Site 13 – IWTP Sludge Disposal Area	Site 13 is located in the northeast corner of the IWTP, between the former IWTP facility and the golf course. IRP investigators indicated that sludge from the IWTP was disposed at the site from 1957 to 1966. Sludge deposits were reported to be 5 to 10 feet thick and covered an area of approximately 200 square feet. It is not known when the Air Force removed the sludge from the site location.	IRP investigators drilled four soil borings and collected subsurface samples. Concentrations of arsenic, cadmium, chromium, copper, lead, nickel, and zinc above industrial soil PRGs were reported for samples collected at 5 feet bgs. Surface soil samples collected during the RI confirmed metals and PCB contamination at the site. The need for a removal action was assessed in an EE/CA, and the decision to perform a soil removal was documented in an AM. Additional data were collected to assess the treatment of the waste. The contaminated soil was removed. Excavated soil was taken to the Site 2 landfill for use as a sub-base for the final cover. The removal action is documented in a closure report. Some residual contamination above residential PRGs was detected in confirmation samples, i.e., thallium. Thallium concentrations were not elevated in pre-removal action samples, nor is the thallium a COC for other areas of the base. The elevated thallium concentrations are likely an analytical laboratory artifact and not related to the site. BWFS concluded that the residual contamination does not pose a risk to human health. The Air Force concluded that all contamination in excess of residential PRGs was addressed in the 1996 removal action, which removed the contamination, and no further action is required at Site 13.	IRP Stage 3 (Ecology and Environment, 1989); RI, 15 IRP Sites OU (CDM, 1993b); EE/CA Sites 13, 14, 22 (Ogden, 1996a); AM Sites 13, 14, 22 (USAF, 1996b); Site 13 Bench-Scale Plan and SAP (Ogden, 1996b); Closure Report Sites 13 and 14 (Ogden, 1997); BWFS (CDM, 2003)
IRP Site 14 – Waste Pit No. 4	Site 14 was part of the Civil Engineering compound adjacent to Building 412. It was the location of two pits used for disposal of waste paints and thinners. The pits were filled with gravel that was periodically removed and replaced. Use of the pits had ceased by 1986.	Soil samples collected during the 1991-1993 RI indicated the presence of paint waste. Although the results of the risk assessment indicated no significant health threat due to the depth of the contamination, the recommendation was made for a cosmetic cleanup. Site cleanup options were assessed in an EE/CA and documented in an AM. Soil was excavated and disposed at the Laidlaw facility in Westmorland, California. Minor paint waste remains below 18 feet bgs. Because the original risk was acceptable, the Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, which removed the contamination, and no further action is required for Site 14.	RI, 15 IRP Sites OU (CDM, 1993b); EE/CA Sites 13, 14, 22 (Ogden, 1996a); AM Sites 13, 14, 22 (USAF, 1996b); Closure Report Sites 13 and 14 (Ogden, 1997)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
IRP Site 15 – S-290 Tank	Site 15 is the location of a former 12,000-gallon UST near the corner of 102nd and 'U' Street in the northeast base area. The UST was originally part of a base service station that existed from the mid-1940s to the early 1970s. Beginning in 1975, the tank was used for the storage of waste petroleum, oils, and lubricants. The tank was removed in late 1986/early 1987.	IRP investigators collected soil gas and subsurface soil samples at the site. No compounds indicative of fuels, oils, or grease were detected. During the RI, soil borings were drilled, and soil samples were analyzed for metals and fuels. No detections exceeded residential PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for Site 15.	IRP Stage 3 (Ecology and Environment, Inc., 1989); RI, 15 IRP Sites OU (CDM, 1993b); DD NFRAP Sites 7, 11, 15, and 18 (USAF, 1996e); BWFS (CDM, 2003)
IRP Site 16 – ACCS Evaporation Basins	Site 16 consisted of two evaporation basins that had been used for disposal of photographic liquid waste generated in the adjacent ACCS (formerly AAVS) building. One of the basins was used for the disposal of ammonium and sodium thiosulfate waste; the other was used for disposal of brine solutions from the AAVS power plant. The evaporation basins were constructed in 1976 and removed in 1996. The basins were located immediately east of the ACCS building and immediately west of the Site 2 landfill.	IRP investigators installed monitoring wells and sampled soil from the well boreholes. Cyanide was the only COC detected in the soil samples. During the RI, slant borings were drilled beneath the basins, and soil gas samples were collected. No chemicals indicative of photographic waste were detected in the soil or soil gas samples. The ACCS waste treatment facility was operated under an RCRA permit with the State of California. Closure of the ACCS facility involved removal of the evaporation basins. The removal action, which addressed CERCLA soil cleanup criteria, was performed during 1996. As part of the closure, the Air Force was requested to perform additional groundwater monitoring. The Air Force completed its obligations for groundwater sampling, and the site was approved by RCRA for closure without controls. The Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, which removed the contamination, and no further action is required for Site 16.	IRP Stage 3 (Ecology and Environment, Inc., 1989); RCRA Closure Plan Phase II, ACCS (Morrison-Knudsen Corporation, 1996a); ACCS Closure Certification Report (Morrison-Knudsen Corporation, 1996b); RI, 15 IRP Sites OU (CDM, 1993b); WP and Field SAP Installation MW298 and Sampling ACCS Wells (CDM, 1996m); Summary Report Installation of MW298 and Sampling ACCS Wells (CDM, 1996i); Partial Closure Certification Acceptance for Hazardous Waste Management Units, ACCS (DTSC, 2002)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
IRP Site 18 – AVGAS Spill Areas	Site 18 was the location of fuel and oil spills related to the former fuel storage distribution facilities that included two 55,000-barrel aboveground JP-4 fuel tanks. The fuel system was removed in 1996.	During the RI, surface soil samples were collected. PAHs and lead were detected at average concentrations below the residential PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for Site 18.	RI, 15 IRP Sites OU (CDM, 1993b); DD NFRAP Sites 7, 11, 15, and 18 (USAF, 1996e); BWFS (CDM, 2003)
IRP Site 20 – Low Level Radioactive Waste Burial Site	Site 20 was reported in the 1982 records search as a burial location for paints and paint materials that were used for painting of luminescent aircraft dials with radium-based paints. Verbal reports indicated that the waste was buried within a cement-filled steel pipe. There are no written reports of the waste burial activity. The location of the site was reported to be near the second tee of the golf course.	GPR investigations performed to locate the concrete bunker initiated during the IRP were repeated in 1992, and again in 1995 under the basewide radiological investigation. The 1995 investigation included excavation of geophysical anomalies at the golf course. A cement-filled structure was never encountered. The 1995 investigation report recommended no further action related to the alleged bunker. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for Site 20.	IRP Stage 3 (Ecology and Environment, Inc., 1989); Investigation of Site 20 (Chem-Nuclear, Inc., 1992); Site 20 Bunker Investigation WP (IT Corporation, 1994); Soil Characterization Basewide Radionuclide Characterization (IT Corporation, 1996); (BWFS, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
IRP Site 21 – ACCS Underground Ferricyanide Tank	The Site 21 underground ferricyanide tank was one of four waste collection sumps that comprised a portion of the ACCS's photographic waste treatment process. The sump was constructed of metal and was 5 feet in diameter and 12 feet deep. The sump was taken out of service by 1991, and was removed as part of the closure of the ACCS waste treatment facility in 1996.	Soil gas and soil samples were collected during the IRP. No chemicals were detected above residential PRGs. The waste treatment tanks were removed as part of the RCRA closure of the ACCS waste treatment facility. As part of the closure, the Air Force was requested to perform additional groundwater monitoring of the site location. Cyanide was detected below the MCL during groundwater sampling and was the only chemical not related to the adjacent Site 2 landfill. Groundwater sampling for cyanide ceased in October 2000, and the site was approved for closure without controls by RCRA. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for Site 21 under CERCLA.	IRP Stage 3 (Ecology and Environment, Inc., 1989); RCRA Closure Plan Phase II, ACCS Morrison-Knudsen, 1996a; ACCS Closure Certification Report (Morrison-Knudsen Corporation, 1996b); WP and Field SAP Installation MW298 and Sampling ACCS Wells (CDM, 1996m); Summary Report Installation of MW298 and Sampling ACCS Wells (CDM, 1996i); April 1997 Groundwater Sampling Results and Data Trends for MWs, ACCS (CDM, 1997c); October 2000 Groundwater Sampling Results (Earth Tech, 2001c); Partial Closure Certification Acceptance for Hazardous Waste Management Units, ACCS (DTSC, 2002)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
IRP Site 22 – IWTP Discharge Ditch and Outfall Area	Site 22 was located along the south boundary of the base south of the IWTP facility. The site was identified by IRP investigators in 1987. Site 22 was described as the historical outfall of treated water from the IWTP. Between 1960 and 1987, treated water was discharged into a ditch leading to the Santa Ana River. Due to the sandy soils and intermittent flows of the river, the discharge did not always reach the river. In 1987, the discharge was redirected onto the base and into a seepage pond (AOC 70) west of the IWTP facility and golf course. Following closure of the base, Central Avenue (renamed Palm Meadows Drive) was extended over Site 22 to provide public access to the golf course, and the majority of the site now lies beneath a paved portion of this roadway.	During the IRP, one sediment sample was collected; the location was not specified. During the RI, surface samples were collected from nine locations; five were at the outfall location (now Palm Meadows Drive). Arsenic, cadmium, and chromium exceeded 1994 residential PRGs in samples collected from the outfall area. Prior to paving Palm Meadows Drive, which became the new off-base access to the golf course, the area was graded using standard construction practices to develop the roadway sub-base, thus mixing the Site 22 soil with the surrounding soil. The need to remediate the site was addressed in an EE/CA, and the AM identified NFA for Site 22. The NFA was based on the average exposure point concentration of arsenic (the only COC detected), which was below U.S. EPA accepted background average of 5 mg/kg. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for IRP Site 22.	EE/CA Sites 13, 14, 22 (Ogden, 1996a); AM Sites 13, 14, 22 (USAF, 1996b)
AOC 1 – Building 248	Building 248 was a radar installation for computer-tracking and early warning detection of aircraft and missiles from 1958 to 1968. After 1968, the building housed the ACCS (formerly AAVS) facility until base closure. Operations included the use, storage, and disposal of solvents, paints, cyanide, potassium, and sodium thiosulfate, and other film development-related chemicals that were treated in the waste treatment plant. Also associated with the building is a dry well that may have received waste. The concern for the AOC was the presence of waste in the dry well. The Building 248 waste treatment facility was investigated and closed under a state-led RCRA closure action.	During the CS, lead and copper were detected above residential soil PRGs in a soil sample collected from the base of the dry well. The CS recommended further evaluation under the ESI. Twelve soil samples were collected during the ESI, and residential soil PRGs were not exceeded for the AOC 1 area overall. Based on the ESI, the Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 1.	BW CS Results (CDM, 1995); ESI Results (CDM, 1996c); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 2 – Building 258	Building 258 was used as the hazardous materials storage location for Building 248. The building consisted of a flammable materials room and an acid room. Each contained floor drains connected to two sumps. The concern for the AOC was the disposal of chemicals in the drains, sumps, and soil beneath the building.	During the CS, contents of the sumps were sampled and soil borings were drilled adjacent to the sumps. Metals, cyanide, and PAHs were reported in the sump and soil samples, but at concentrations typically below residential soil PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 2.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 3 – Building 295	Building 295 was used as an automotive repair facility and vehicle wash rack from the early 1940s until the late 1960s/early 1970s. The wash rack drained to a sump. A dirt lot now occupies the site for the former structure. The concern for the CS was to determine whether vehicle repair/washing activities had impacted soils at the location.	During the CS, soil gas samples were collected at nine locations throughout the area of the former vehicle repair/washing facilities. A sediment sample was collected from the sump, and a soil boring was drilled adjacent to the sump. No COCs were detected in the soil gas samples, and no COCs were detected above residential soil PRGs. Based on these results, the CS recommended cleaning of the sump, and no further investigation of AOC 3. The sump was cleaned out as part of a series of basewide cleanup actions. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 3.	BW CS Results (CDM, 1995); Closure Report Site 8, AOCs 3, 23, 37, 38, and the Heating Oil Line (Bechtel, 1997c); BWFS (CDM, 2003)
AOC 5 – Building 302	Building 302 was used for aircraft or vehicle maintenance throughout the history of Norton AFB. Prior to base closure, the facility was used by civilians as an auto maintenance shop, hobby shop, printing shop, photo lab, and woodworking shop. The concern for the AOC was maintenance chemicals, fuels, solvents, and oil/grease in soils.	During the CS, 17 soil gas samples were collected beneath the floor of the building. Soil borings were drilled near hydraulic lifts. No COCs were detected in any of the soil gas or soil samples. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 5.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 6 – Buildings 313, 317, 320	Building 313, which was built in the 1940s, was originally used as a warehouse. By 1962, the facility had become an automotive maintenance facility. Former Buildings 317 and 320 were located north of Building 313. Building 317 was used as an inspection/grease rack, and Building 320 was used in the 1950s and 1960s as a hobby and paint shop. The concern for the AOC was the presence of automotive chemicals, fuels, solvents, and paints in soils.	During the CS, soil and soil gas samples were analyzed for solvent and fuel chemicals. No COCs were detected in excess of residential PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 6.	BW CS Results (CDM, 1995; BWFS (CDM, 2003)
AOC 7 – Building 330	Building 330 was used as a warehouse from the 1940s to the 1960s. Sometime in the 1970s, the building was converted into an auto body and paint shop, including vehicle stripping, sanding, and painting. The concern for the AOC was the possibility of paint waste being disposed in soils near the building.	During the CS, soil samples were collected from suspected waste disposal locations. Metals and compounds indicative of oil and grease were detected but not in excess of residential PRGs. However, the CS recommended further investigation under the ESI. During the ESI, six additional soil borings were drilled, and samples were analyzed for metals only. Metals in some samples exceeded background levels but did not exceed residential soil PRGs overall. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 7.	BW CS Results (CDM, 1995); ESI Results (CDM, 1996c); BWFS (CDM, 2003)
AOC 8 - Building 337	Building 337 was used as an aircraft, vehicle, and equipment wash rack from the 1940s until base closure. The facility included an oil-water separator that was removed under the Norton AFB UST program. The concern for the AOC was aircraft and automotive chemical waste in soils.	During the CS, 12 soil gas samples were analyzed for AOC 8. Volatile COCs were not detected in any of the samples. Two soil borings were drilled at the oil-water separator area. PAHs and metals were detected below residential soil PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 8.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 9 - Buildings 333 and 341	Buildings 333 and 341 were used as aircraft maintenance hangars from the early 1940s to the mid-1960s, when they were converted into automotive maintenance facilities. Waste oil was drained into a 1,000-gallon UST. The concern for the AOC was maintenance waste in soils, including hydraulic fluids.	During the CS, soil and soil gas samples were collected, and no COCs were detected above residential PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 9.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 10 – Building 336	Building 336 was a vehicle washing facility from 1973 to the late 1980s. The wastewater collection system associated with the building included two trench drains, a junction box, and a sand and grease trap. Hazardous materials were stored in a structure located to the west of the washing facility. The concern for the AOC was the presence of vehicle waste (fuels, oil/grease, metals) in soils.	During the CS, five soil gas samples were collected, and no COCs were detected above residential PRGs. A sediment sample collected from the grease trap contained benzene above the residential PRG. A soil boring was drilled next to the trap, but fuel chemicals were not detected. The grease trap was cleaned as part of general housekeeping, and the contents properly disposed. The Air Force concluded that there was no release of contamination at the site, and no further action is required for AOC 10.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 11 – Building 338	Building 338 was constructed in the 1940s and used for sanitary latrine purposes during the 1950s and 1960s. The building was later used as a battery shop until late 1991. The concern for the AOC was the disposal of battery acid waste into soils at the AOC.	During the CS, four soil borings were drilled beneath the building and analyzed for metals, pH, and nitrates. All metals detected were within background range, and the soil pH was in the neutral range. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 11.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 12 – Building 344	Building 344 was used as a film library in the 1940s and as a warehouse during the 1950s and early 1960s. In 1964, the building was converted to a dry cleaning and laundry facility. The building contained a concrete vault and trench drains. A buried drum was identified adjacent to the building. The concern at this AOC was the presence of dry cleaning solvents in soils beneath and adjacent to the building.	During the CS, five soil gas samples were collected, and two soil borings were drilled. Although no COCs were detected above residential PRGs, 7 soil and 38 soil gas samples were collected from the Building 344 vicinity during the ESI. No COCs were detected in the soil samples. TCA and PCE were detected in soil gas samples. Therefore, due to potential indoor air risk, the AOC was evaluated in the BWFS. The BWFS concluded that AOC 12 does not pose adverse risk due to the inhalation pathway. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required.	BWFS (CDM, 2003)
AOC 13 – Building 345	Building 345 was a civilian vehicle washing facility installed in the mid-1980s. The facility includes a wash water collection system connected to a sand/grease trap. The concern for the AOC was automotive waste (fuels, oil/grease, and metals) in soils.	Soil and soil gas samples were collected from Building 345 during the CS and ESI. No COCs were detected above residential PRGs in soil. Because of the proximity of AOCs 12 and 13, AOC 13 was evaluated for indoor air risk in the BWFS. TCA and PCE were detected but at concentrations less than those detected at AOC 12. The BWFS concluded that AOC 13 does not pose adverse risk due to the inhalation pathway. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required.	BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Page 12 of 27

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 14 – Buildings 405 and 408	Building 405 was a gasoline storage facility, and Building 408 was a motor pool shed during the 1950s and 1960s before the location of the buildings was redeveloped as officer's housing. There is a 1967 record of a UST associated with the site, but no record of a UST removal.	Soil gas surveys were conducted, and no COCs were identified. A GPR survey was conducted to locate any remaining USTs. A subsurface anomaly was reported, and the location of the anomaly was excavated. The anomaly was found to be an 8-foot-long, 4-inch-diameter cast iron pipe and a 4-inch-diameter plastic pipe. Both pipes had been filled with concrete. No UST was found at the site of the AOC. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 14.	BW CS Results (CDM, 1995); Soil Characterization, Basewide Radionuclide Characterization (IT Corporation, 1996)
AOC 15 – Building 432	Building 432 was the site of an automotive maintenance facility constructed in 1942 and removed in the late 1960s before being paved as a dormitory parking lot. The concern of the AOC was residual automotive waste in soils.	During the CS, seven soil gas samples and one soil sample were collected at AOC 15. Extremely low fuel and solvent chemicals were reported from one soil gas sample. No COCs were detected in the soil sample. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 15.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 16 – Building 435	Building 435 was the site of an engine testing and automotive maintenance facility constructed in 1942 and removed by the early 1970s before being paved as a dormitory parking lot. The concern for the AOC was residual automotive waste.	During the CS, seven soil gas samples were collected. No COCs were detected in the samples. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 16.	BW CS Results (CDM, 1995)
AOC 17 – Buildings 441 and 442	Buildings 441 and 442 were former vehicle and equipment wash rack facilities constructed in 1942 and removed by the early 1970s before being paved for a dormitory parking lot and driveway. The concern for the AOC was residual vehicle waste.	During the CS, ten soil gas samples were collected. No COCs were detected. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 17.	BW CS Results (CDM, 1995)
AOC 19 – Buildings 576 and 578	Buildings 576 and 578 were a former automotive repair shop and wash rack that was in operation from 1943 through the late 1960s. At the time of the CS, only the concrete foundations of the buildings remained. The concern for the AOC was the presence of automotive repair waste chemicals in soils.	During the CS, seven soil gas samples were collected and one soil sample was analyzed for fuel and solvent chemicals. One of the soil gas samples contained low levels of fuel chemicals. The soil sample did not contain detectable fuel or solvent chemicals. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 19 (CDM, 1995).	BW CS Results CDM, 1995); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 20 - Building 635	Building 635 was a chemical and salvage warehouse that stored flammable and inflammable chemicals, poisons, and acids from 1942 to 1968. In 1968, half of the building was converted to vehicle maintenance; the other half to offices. The concern for the AOC was the presence of chemicals from the time it was used for chemical storage and for the presence of automotive repair chemical waste in soils.	During the CS, 14 soil gas samples and 4 soil samples were analyzed. Fuel and solvent chemicals were reported at low levels in one of the soil gas samples. No COCs were detected in the soil samples above residential PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 20.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 21 – Building 638	Building 638 housed radio repair, electronics, and armament repair shops. Constructed in 1942, it was occupied by the communications squadron at the time of base closure. Because the building contained a paint spray booth, the concern for the AOC was waste paint, PCBs, and solvents used to clean electronics.	During the CS, COCs were not detected in the five soil gas samples or two soil samples collected. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 21.	BW CS Results (CDM, 1995)
AOC 22 – Building 653	Building 653 housed a fueling system that stored No. 1 aircraft gasoline. The building was constructed in 1942, and its associated USTs were removed in the early 1980s. The concern for the AOC was the presence of fuel chemicals in soils.	Ten soil gas samples were analyzed during the CS. Toluene and TCE were detected at very low concentrations in one sample. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 22.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 23 – Building 655	Building 655 housed an aircraft reclamation facility and repair shop depot from 1942 to the late 1960s. Chemical use and disposal activities were reported for this building. The concern for the AOC was the presence of solvents in soils.	During the CS, 14 soil gas samples were collected, and 4 soil borings were drilled. TCE was detected, and diesel was reported for one soil sample. Based on these findings, additional investigation was performed under the ESI. A total of 52 additional soil gas samples, collected from depths between 5 and 20 feet bgs, were analyzed, with the maximum TCE concentration found beneath the central portion of the building at a depth of 20 feet bgs. Eleven soil borings were drilled, and no COCs were detected above residential PRGs. Due to indoor air risk concerns, AOC 23 was evaluated in the BWFS. The BWFS concluded that AOC 23 does not pose a risk to human health due to the inhalation pathway. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 23.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 24 – Building 658	Building 658 was used as an equipment maintenance facility from 1942 to the 1960s, and later for storage, offices, and the base's printing and reproduction operations until base closure. A sump in the north portion of the building was identified as a TCE source location during the CBA TCE source investigation. Because chemical use was known to occur in this building, the concern for the AOC was the removal of TCE-contaminated soils and identification of TCE in soil beneath the southern half of the building.	As part of the TCE source remedial action for the CBA OU ROD, a sump and TCE-contaminated soil were removed in 1995, immediately north of Building 658. During the CS, TCE was detected in soil gas samples but not in any of the five soil samples. Based on the soil gas results, the study concluded that the source of TCE in soil gas had been remediated as part of the sump removal. The Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, and no further action is required for AOC 24.	Earth Tech, 1996a; BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 25 – Building 678	Building 678 was an armament repair facility constructed in 1943 and razed early in the 1970s. Air Force records indicate that solvents (TCE), lube oil, and carbon removers were used in the building. The concern for the AOC was the presence of solvents and petroleum hydrocarbons in soils beneath the building's former footprint.	During the CS, 12 soil gas samples were collected, and 1 soil boring was drilled. PCE was detected in one of the soil gas samples. No COCs were detected in the soil samples. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 25.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 26 – Building 695	Building 695 was used as an aircraft fuels maintenance hangar from 1942 until base closure. Fuel tanks were cleaned at the facility, and waste was discharged to an oil-water separator. The concern for the AOC was fuels in soils.	During the CS, 12 soil gas samples were collected at this AOC. COCs were not detected in any of the samples. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 26.	BW CS Results (CDM, 1995)
AOC 27 – Building 705	Building 705 was used as an engine processing facility from the 1940s to the mid-1960s when it was converted to a motor pool storage facility. Significant chemical use in the repair of aircraft engines was reported for the facility. The concern for the AOC was solvent and fuel waste remaining in soils.	During the CS, 19 soil gas samples were collected, and no COCs were detected. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 27.	BW CS Results (CDM, 1995)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 28 – Building 707	Building 707 was used as a rubber reclamation and repair facility from 1944 to the mid-1960s and later as a printing and publications operation until base closure. Base records indicate significant chemical use including solvents, TCE, oil, and carbon removers for the building. The concern for the AOC was the presence of solvents in soils.	During the CS, four soil gas samples were collected, and four soil borings were drilled. TCE was detected at low concentrations in soil gas, and diesel was detected in soil samples. Additional investigation of Building 707 was performed during the ESI, but no significant contamination was reported. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 28.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 29 – Buildings 723, 724, 725	Building 723 was an engine testing facility from early 1942 to the early 1980s. It was connected via pipelines to Buildings 724 and 725 that housed large USTs containing fuels. The concern for the AOC was to determine whether the USTs were present and had impacted the soil due to fuel leakage.	During the CS, a GPR survey determined that the USTs had been removed. Eleven soil gas samples were collected from the Building 724 and 725 area, and no COCs were detected. Eleven soil gas samples were collected in the Building 723 area, and low levels of benzene, toluene, and xylene were detected. Additional soil gas and soil sampling was performed during the ESI. No significant fuel contamination was reported. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 29.	BW CS Results (CDM, 1995); ESI Results (CDM, 1996c); BWFS (CDM, 2003)
AOC 30 – Building 726	Building 726 was used as an engine testing cell from the late 1940s until 1992. The building was connected to USTs for fueling engines during static testing. The concern for this AOC was the presence of fuels in soils beneath the building.	During the CS, 17 soil gas samples were analyzed for fuel chemicals. Low concentrations of fuel chemicals were detected in one sample. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use, and no further action is required for AOC 30.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 31 – Building 736	Building 736 was a hazardous test and fuels accessory facility from 1950 to the late 1960s when it was converted to a plastics shop, battery shop, mechanical equipment room, and refrigeration shop. The building included a sump and UST farm. The concern for the AOC was the leakage of chemicals and battery waste.	During the CS, TCE was reported in a soil gas sample, which warranted additional investigation of AOC 31. During the ESI, 37 soil gas samples were analyzed, and TCE was reported at a depth of 10 feet bgs. Based on an indoor air risk concern, AOC 31 was evaluated further in the BWFS. The BWFS concluded that AOC 31 does not pose a risk to human health due to the inhalation pathway. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use, and no further action is required.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 32 – Building 741	Building 741 was used as a dry cleaning plant and an electronics overhaul facility from the mid-1940s through the late 1960s. The concern for this AOC was solvents in subsurface soils.	During the CS, six soil samples were analyzed for solvents and fuel chemicals. There were no detections of solvents or fuels. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 32.	BW CS Results (CDM, 1995)
AOC 34 – Building 749	Building 749 was constructed in 1944 for use in aircraft overhaul and repair. In the mid-1960s, it was converted to a warehouse and for aircraft latrine services. The concern for the AOC was solvents and fuel chemicals in subsurface soils.	During the CS, 22 soil gas samples were analyzed for solvent and fuel chemicals. Low levels of VOCs were reported in two of the samples. Eight soil borings were drilled during the CS and ESI, and low concentrations of fuel chemicals (diesel) were detected. Based on an indoor air risk concern, AOC 34 was evaluated further in the BWFS. The BWFS concluded that AOC 34 does not pose a risk to human health due to the inhalation pathway. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 34.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 35 – Building 755	Building 755 was a blacksmith shop and foundry from the 1940s through the late 1960s. Metal plating operations were reported for the building. The concern for this AOC was solvents and metals in subsurface soils.	During the CS, 11 soil gas samples were analyzed for VOCs of which 8 had detectable TCE. Soil borings identified a single detection of lead in excess of the residential PRG. During the ESI, 61 soil gas samples, collected from depths ranging between 11 and 20 feet bgs, were analyzed, and TCE was found at a depth of 20 feet bgs. Eight soil borings were drilled, and all detections were below residential PRGs. Based on an indoor air risk concern, AOC 35 was evaluated further in the BWFS. The BWFS concluded that AOC 35 does not pose a risk to human health due to the inhalation pathway. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 35.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 36 – Building 795	Building 795 has been used as an aircraft hangar since 1942. Various types of aircraft were repaired in the building over the course of its history. The concern for the AOC was the presence of solvents and fuels in soils beneath the hangar.	During the CS, 17 soil gas samples were collected, and one soil boring was drilled at the AOC. TCE was detected in the soil gas samples. No COCs were detected in the soil samples. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 36.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 37 – Refuse Dump Area	The Refuse Dump area was used as a collection point for general refuse and debris. It also contained a washing pad where street sweepers were cleaned. The concern for this AOC was oils, grease, fuels, hydraulic fluids, and metals from waste handling and vehicle washing.	During the CS, four surface soil and three sediment samples were collected, and two soil borings were drilled. The samples contained fuel and grease compounds and PCBs. The extent of contamination was defined during the ESI by drilling 35 soil borings. The ESI recommended removal of soil containing PCBs and petroleum chemicals above residential soil PRGs. Cleanup options were assessed in an EE/CA and documented in an AM. The soil removal action was conducted during October through December 1996. The Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, which removed the contamination, and no further action is required for AOC 37.	BW CS Results (CDM, 1995); ESI Results (CDM, 1996c), EE/CA Parcel I-3 (CDM, 1996h); AM, Parcel I-3 (USAF, 1996d); Closure Report, IRP Site 8, AOCs 3, 23, 37, 38 and the Heating Oil Line (Bechtel, 1997c)
AOC 38 – C Street Outfall	The C Street Outfall represents the storm water discharge point of storm water collected in the northern CBA and northern airfield and flight line. Chemical use, aircraft cleaning, and aircraft fueling activities occurred in the area of surface water collection that discharged at the outfall. The concern for this AOC was fuels, hydraulic oils, and oil and grease in sediment in the outfall area.	During the CS, sediment, surface, and subsurface soil samples were collected. Diesel, oil, and grease and PCB compounds were detected. During the ESI, 15 soil borings were drilled to define the extent of contamination. The ESI recommended removal of soil containing petroleum and PCB chemicals above residential soil PRGs. Cleanup options were assessed in an EE/CA and documented in an AM. The soil removal action was conducted during October through December 1996. The soil removal action achieved unrestricted land use criteria. The Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, which removed the contamination, and no further action is required for AOC 38.	BW CS Results (CDM, 1995); ESI Results (CDM, 1996c); EE/CA Parcel I-3 (CDM, 1996h); AM, Parcel I-3 (USAF, 1996d); Closure Report, IRP Site 8, AOCs 3, 23, 37, 38 and the Heating Oil Line (Bechtel, 1997c)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 40 – Golf Course Maintenance Area	AOC 40 is located at the southern end of the former IWTP compound along the southern perimeter of the base and was used by the golf course maintenance group to store and mix a variety of pesticides, herbicides, and fungicides. Reported spills of fungicides occurred in sheds 7 and 8, and spills of arsenic-based chemicals reportedly occurred between sheds 4 and 5. Containers that had decayed because of improper storage and exposure to rain caused several spills. Additionally, a location near the southern end of Shed 7 may have been used for the disposal of waste oil.	AOC 40 was investigated under the CS and ESI. During the CS, cadmium was detected in two surface soil samples above the residential PRG, and chlordane was detected above the residential PRG in one surface soil sample. During the ESI, cadmium, chlordane, and PCBs were reported above residential soil PRG concentrations, and arsenic was detected above background at several surface and shallow (less than 5 feet bgs) subsurface soil sample locations. The overall area affected is 60,000 square feet. No groundwater contamination is associated with this site. RAs were evaluated in an EE/CA. Metal sheds, floors, foundations, and soils were removed and properly disposed off site in March 2004. The Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, and no further action is required for AOC 40.	BW CS Results (CDM, 1995); ESI Results (CDM, 1996c); AM (USAF, 1997a); Closure AOC 40 (Earth Tech, 2004)
AOC 41 – Lockheed Soil Pile Treatment Cell	In 1991, as part of the Building 763 refurbishing project that involved reconstruction of two hangar bays to support 747-sized aircraft, Lockheed Corporation rebuilt the hangar floors. The floor reconstruction project involved removal of the existing concrete floor and excavation of sufficient soil to pour a thicker concrete floor. The excavated soil contained the solvent TCE. Approximately 6,300 cubic yards of contaminated soil were taken to a soil treatment cell south of Mill Street and east of Tippecanoe Avenue. The concern for the AOC was residual TCE present in the soil pile and that TCE may have leached into underlying surface soils.	Prior to placement of the soil in the treatment cell, a plastic liner was placed on the ground, and perforated piping (used to aerate the soils) was laid on the plastic liner. A Lockheed Commercial Aircraft Center contractor sampled the soil prior to and after treatment to assess effectiveness of the treatment. The contractor reported finding no TCE. During the CS, six boreholes were drilled through the soil pile so that samples could be collected of the pile and underlying soils. TCE was not detected in any of the samples. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 41.	WP, Excavation and Vapor Extraction Treatment (McLaren-Hart, 1991a); Results Soil Characterization and Evaluation of Treatment and/or Disposal Options (McLaren-Hart, 1991b); Soil Treatment Cell Post Decommissioning Sampling Results (McLaren-Hart, 1992); BW CS Results (CDM, 1995)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 42 – Building 514	Building 514 was constructed in the mid-1950s for use as a chemical storage warehouse. During the period of use, the building contained acid storage rooms, a poison storage room, and a general chemical storage room. The concern for the building was the lack of available environmental data documenting no significant contamination.	During the CS, 16 soil gas samples were collected. Low levels of VOCs were detected in the soil gas samples. Four soil borings were drilled and sampled, and no COCs were detected above residential PRGs. Based on the low levels of VOCs detected, the CS recommended no further action. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 42.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 43 – Building 763 Dock, Buried Sumps	During reconstruction of the hangar bay 4 (Dock 4) floor in Building 763, Lockheed Commercial Aircraft uncovered two buried sumps that contained liquid. The sumps were covered by new pavement before their contents could be characterized. The concern for the AOC was the presence of liquid waste beneath the floor of the hangar.	During the CS, three soil borings were drilled and sampled at the locations of the sumps and analyzed for VOCs and fuels. TCE was detected in one sample, and no other COCs were detected. The TCE source area SVE remediation (as part of the CBA OU remedy) removed TCE from soil beneath Building 763, thus also removing contamination from AOC 43 where the level of contamination released was low. The CS recommended no further action. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 43.	BW CS Results (CDM, 1995); BWFS (CDM, 2003)
AOC 44 – Eastern Golf Course Ash Layer	AOC 44, in the southeastern portion of the GCA, encompasses Site 12 and is adjacent to Site 10. Air Force records indicate that, in the early 1960s, much of the area was vegetated by trees and brush, which were cut down and burned in place in order to construct the golf course. The concern for AOC 44 was to define the extent of the ash layer and to determine whether the ash was inert (i.e., indicative of burning of vegetative matter and not industrial or solid waste).	During the ESI, 144 hand-auger borings were drilled in a grid pattern throughout the eastern extent of the golf course to locate the presence of ash. Where encountered, ash was sampled for the presence of metals. Metals concentrations for the most part were within background levels for Norton AFB, indicating that the ash was from burning of vegetative matter and not waste. Elevated concentrations of metals were restricted to the areas of Sites 10 and 12 where wastes were burned. The Site 10 PAH/dioxin investigation in 2000 included portions of AOC 44. Dioxin contamination was determined to be present and was addressed in the BWFS as part of the Sites 10 and 12 evaluations. The BWFS identified no further action as the preferred alternative for AOC 44 based on the cleanup of IRP Site 10 (see Figure 2-7). The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 44.	ESI Results (CDM, 1996c); Site 10 and 12 Additional Soil Characterization (CDM, 2000e); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 45 – 500 Series Buildings	The 500-series buildings were located in the middle and south portions of the CBA. These buildings were used predominantly for supply and depot warehouses and administrative offices. There was little indication in base records that hazardous chemicals were used or disposed in these buildings. The concern for the AOC was the lack of available environmental data documenting no significant contamination.	During the CS Addendum, 126 soil gas samples were collected from the 500-series buildings area. Benzene and toluene were detected. Based on an indoor air risk concern, AOC 45 was evaluated further in the BWFS. The BWFS concluded that AOC 45 does not pose a risk to human health due to the inhalation pathway. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 45.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)
AOC 46 – 900 Series Buildings	The 900-series buildings were located in the westernmost edge of the CBA. These buildings were primarily used for supply and depot warehouses and administrative offices. The major exceptions were Buildings 922/942/945, Building 948 (the DRMO), and Building 976 (the entomology shop). Buildings 922/942/945 were used for the repair of Titan missiles involving small quantities of chemicals. The DRMO was the primary facility used by the base at the time of closure for the temporary storage of hazardous waste. The concern for the AOC was the lack of available environmental data documenting no significant contamination.	During the CS Addendum, 178 soil gas samples were collected from the 900-series building area. 1,1,1-TCA was detected. Two soil borings were drilled, and no solvents were detected. Based on the low level and infrequent detections of COCs, the CS Addendum recommended no further action. The DRMO facility was closed under an RCRA action, and the Air Force received closure without controls from DTSC for the DRMO facility. Building 976 was investigated as AOC 64, described below. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 46.	Results of CS Addendum No. 1 (CDM, 1996a); RCRA Closure of the DRMO Hazardous Material/Waste Storage Facility (USAF, 1996a); BWFS (CDM, 2003)

Page 21 of 27

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 47 – Detachment 10, Ballistic Missile Organization	The Detachment 10/BMO area is located on a separate parcel of land south of the main portion of the CBA, bordered by Tippecanoe Avenue to the east and Mill Street to the north. The buildings comprising the BMO complex were constructed in the 1950s. The property was transferred to San Bernardino County in 1974 and reacquired by the Air Force in 1982. The property is currently occupied by the Defense Finance and Accounting Agency and is the only portion of Norton AFB to be retained by the military. The concern for the AOC was a former UST and a possible debris pit.	During the CS Addendum, 28 soil gas samples were collected from the BMO area. Four soil gas samples were collected, and three soil borings were drilled at the location of the former UST. No COCs were detected at the BMO or UST area. A debris pit was not encountered during exploratory soil boring. Soil gas samples collected from the vicinity of the suspected pit did not contain COCs. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 47.	Results of CS Addendum No. 1 (CDM, 1996a)
AOC 48 – Former Communication Facility	AOC 48 is a non-contiguous 30-acre parcel of land in the city of Highland, north of the northeastern boundary of Norton AFB. The property was used as a radio communications facility from 1957 to 1966 when it was decommissioned. A portion of the facility had been turned over to the city for a recreational field. The concern for the AOC was the presence of petroleum contamination in soils.	During the CS Addendum No. 1, 43 soil gas samples were collected and analyzed from the AOC 48 area. No COCs were detected. A geophysical survey was performed in the area of the former communications building to determine whether there was a UST associated with it. No UST was detected; however, the survey did identify a buried communications cable. The communications cable is to remain buried at AOC 48. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 48.	Results of CS Addendum No. 1 (CDM, 1996a)
AOC 49 - Building 248 SWAP	AOC 49 represents the SWAP associated with Building 248, the ACCS facility. The SWAP was used to store photochemicals used in the still and motion picture laboratories. The concern for the AOC was photochemical waste in soils.	During the CS Addendum No. 1, a soil boring was drilled at the SWAP to collect samples for VOC analyses. No VOCs were detected. The soil sample was analyzed for cyanide and soil pH only. Cyanide was not detected in the soil sample. The soil pH was below the neutral range for Norton AFB soils and above pH 2.0, but did not indicate contamination. The Air Force concluded that there was no release of contamination, and no further action is required at AOC 49.	Results of CS Addendum No. 1 (CDM, 1996a)
AOC 50 – Building 329 SWAP	AOC 50 is the SWAP associated with Building 329, a small metal building on a cement pad. The SWAP was used to store oil, antifreeze, and soap in 55-gallon drums. The concern for the AOC was waste chemicals in soils.	During the CS Addendum No. 1, a soil boring was drilled at the site. The sample was analyzed for solvents, fuels, petroleum compounds, PCBs, and metals. No COCs were detected above residential soil PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required at AOC 50.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 51 – Building 333 SWAP	AOC 51 is the SWAP associated with Building 333 (AOC 9) where contaminated fuel, antifreeze, waste paint, batteries, oil filters, and rags in 55-gallon drums were stored. A 30-gallon Safety-Kleen solvent tank and a flammable materials storage locker containing oils, grease, and brake fluid were also located within the SWAP. The concern for AOC 51 was petroleum, solvents, metals, and PCBs in soils.	During the CS Addendum No. 1, two soil gas samples were collected, and one soil boring was drilled at the SWAP. No COCs were detected above residential soil PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 51.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)
AOC 52 – Building 341 SWAP	AOC 52 was the SWAP associated with Building 341 (AOC 9). The Building 341 SWAP stored antifreeze, motor oil, transmission fluid, brake fluid, and R12 Freon. The concern for this AOC was petroleum products in soil.	During the CS Addendum No. 1, three soil gas samples were collected, and one soil boring was drilled. No COCs were detected above residential soil PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 52.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)
AOC 53 – Building 403 SWAP	Building 403 was used as a carpentry and paint shop by civil engineering from the 1940s to the 1990s. It contained an SWAP used for the temporary storage of mineral oils, PCBs, Freon, and oil filters in 55-gallon drums. The concern for the AOC was the presence of chemical waste in soils.	During the CS Addendum No. 1, three soil gas samples were analyzed, and a soil boring was drilled at this AOC. No COCs were detected. Based on these findings, the Air Force concluded that there was no release of contamination, and no further action is required for AOC 53.	Results of CS Addendum No. 1 (CDM, 1996a)
AOC 54 – Building 407 SWAP	Building 407 was used for the maintenance of liquid fuels equipment. The SWAP at this building stored rags, JP-4 aviation fuel, diesel, gasoline, oil, and grease in 55-gallon drums. The concern for the AOC was the presence of chemical waste in soils.	During the CS Addendum No. 1, one soil gas sample was analyzed, and one soil boring was drilled at this AOC. COCs were not detected. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 54.	Results of CS Addendum No. 1 (CDM, 1996a)
AOC 55 – Building 412 SWAP	Building 412 was used as a storage facility for paints and other related materials as well as a maintenance facility as part of civil engineering painting operations. Paints, acids, oils, grease, lighter fluid, lubricating oil, hydraulic oil, and sealers were stored at this SWAP. The concern for the AOC was the presence of chemical waste in soils.	During the CS Addendum No. 1, five soil gas samples were collected, and one soil boring was drilled. Acetone, methyl ethyl ketone, and PCE were reported at low concentrations in soil gas, but no COCs were detected in soil above residential PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 55.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 56 – Building 417 SWAP	The Building 417 SWAP was used for storage of automotive waste, including Penetron, waste oil, absorbent, and batteries. The concern for the AOC was the presence of chemicals in soils.	During the CS Addendum No. 1, one soil gas sample was collected, and one soil boring was drilled. Acetone and methyl ethyl ketone were reported at low concentrations in soil gas, but no COCs were detected in soil. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 56.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)
AOC 57 – Building 427 SWAP	Building 427 was used as a diesel locomotive storage shed and a fuels storage facility. Waste stored at the SWAP included mineral oil and PCBs in 55-gallon drums. The concern for the AOC was the presence of waste chemicals in soils.	During the CS Addendum No. 1, one soil boring was drilled. No COCs were detected. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 57.	Results of CS Addendum No. 1 (CDM, 1996a)
AOC 58 – Building 468 SWAP	Building 468 once housed a diesel-powered generator and UST. The SWAP was used for storage of compressed gas cylinders, hydraulic fluid, and spray wax. The concern for the AOC was the presence of waste chemicals in soils.	During the CS Addendum No. 1, three soil gas samples were analyzed. Acetone and methyl ethyl ketone were detected at low concentrations. Five soil borings were drilled, and a single detection of benzo(a) pyrene exceeded the residential PRG. The CS Addendum recommended additional characterization to define the extent of PAH contamination. AOC 58 was further evaluated during the ESI Addendum No. 1. Analysis of samples collected from five additional soil borings identified low levels of petroleum compounds. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 58.	Results of CS Addendum No. 1 (CDM, 1996a), Results of ESI Addendum No. 1 (CDM, 1996d); BWFS (CDM, 2003)
AOC 59 – Building 620 SWAP and AOC 68 - Building 620 Car Wash	AOC 59 was the former civilian service station and AOC 68 was the former car wash rack. The SWAP associated with the service station stored used solvents, used and drained oil filters, and used antifreeze. The car wash rack was used by personnel to clean personal vehicles. The concern for the AOC was the presence of petroleum and automotive waste chemicals in soils.	During the CS Addendum No. 1, eight soil gas samples were analyzed from the SWAP and washrack areas. Acetone and methyl ethyl ketone were reported at low concentrations. One soil boring was drilled; however, no automotive waste chemicals were detected. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required at AOCs 59 and 68.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 60 – Building 675 SWAP	AOC 60 was the SWAP associated with Building 675, the aircraft ground equipment facility. The SWAP consisted of two small metal sheds. Materials stored at this location included hydraulic fluid, Pensolv solvent, paint waste, JP-4 fuel, diesel fuel, fuel filters, oil filters, antifreeze, and engine oil. The concern for the AOC was fuels, petroleum products, paint waste, and metals in soils.	During the CS Addendum, four soil gas samples were collected from a depth of 15 feet bgs, and five soil borings were drilled at the SWAP. TCE, ethylbenzene, and xylene were reported at low concentrations. Field instruments identified the presence of fuels in some of the soil samples. Based on the initial results, the CS Addendum recommended further investigation under the ESI Addendum field program. During the ESI Addendum, five additional soil gas samples were collected. No COCs were detected. Three additional soil borings were drilled; all detections were below residential soil PRGs. Due to indoor air risk concerns, AOC 60 was evaluated in the BWFS. The BWFS concluded that AOC 60 does not pose a risk to human health due to the inhalation pathway. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 60.	Results of CS Addendum No. 1 (CDM, 1996a); Results of ESI Addendum No. 1 (CDM, 1996d); BWFS (CDM, 2003)
AOC 61 – Building 680 SWAP	AOC 61 is the SWAP associated with the former Norton AFB fire department (Building 680). The SWAP consisted of an 8 by 8 foot area on the north side of the building. Materials stored at this location included household cleaning products, copier developer, transmission fluid, lubricants, absorbent materials containing waste oil, hydraulic fluid, diesel, and unleaded gasoline. The concern for AOC 61 was petroleum and fuel chemicals in soils.	During the CS Addendum No. 1, one soil gas sample was collected, and low levels of TCE were reported. One soil boring was drilled; however, no COCs were detected. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 61.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)
AOC 62 – Building 825 SWAP	Building 825, a metal shed (approximately 32 by 27 feet in size) located behind the driving range of the golf course, is used for the storage of herbicides for golf course operations. The concern for AOC 62 was the presence of herbicide and pesticide chemicals in soils.	During the CS Addendum No. 1, two soil samples were collected. Several pesticides and herbicides were detected, but below residential PRGs. However, the CS Addendum recommended further investigation under the ESI Addendum field program. In addition to pesticides/ herbicides, soil samples were analyzed for metals and PCBs. No COCs were detected above residential soil PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 62.	Results of CS Addendum No. 1 (CDM, 1996a); Results of ESI Addendum No. 1 (CDM, 1996d); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 63 – Building 950 SWAP	AOC 63 was an SWAP associated with Building 950 located in the southeast corner of the BMO property. The SWAP consisted of three storage conex boxes each approximately 6 by 8 feet in size. The total area of the SWAP was 75 by 75 feet. Adhesives, lubricants, paints, refrigerants, waste Freon, used batteries, spent solvent, and waste oil was stored at the SWAP. The concern for the AOC was the presence of waste chemicals in soils.	During the CS Addendum No. 1, six soil gas samples were collected, and one soil boring was drilled. No COCs were detected above residential PRGs. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required at AOC 63.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)
AOC 64 – Building 976 SWAP	Building 976 was the base's Entomology Shop where insecticides and herbicides were mixed and stored. The concern for the AOC was the presence of pesticides/herbicide chemicals in soils beneath the concrete slab that supported the building.	During the CS Addendum No. 1, 14 soil borings were drilled through the concrete foundation. Low levels of metals (arsenic above background in only 1 of 31 samples) and pesticides below residential PRGs were reported in the soil samples. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 64.	Results of CS Addendum No. 1 (CDM 1996a); BWFS (CDM, 2003)
AOC 65 – Delta 7 SWAP	The Delta 7 SWAP consisted of two sheds located at the northwest edge of the flight line. Materials stored at one shed included hydraulic fluid, engine oil, grease, and flammable materials; the second shed stored waste engine oil, waste hydraulic fluid, crushed cans, used batteries, and other items. The concern for the SWAP was fuels, petroleum chemicals, and metals in soils.	During the CS Addendum No. 1, four soil gas samples were collected from the vicinity of the SWAP. No COCs were detected in the samples. One soil boring was drilled; the sample collected from the surface to 1.5 feet bgs was analyzed for VOCs, SVOCs, metals, and PCBs. No VOCs or SVOCs were detected. Detected metals were within background range, and no PCBs were detected. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 65.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)
AOC 66 – Gate 10 SWAP	Gate 10 was the westernmost point of entry into Norton AFB. After this gate was no longer needed, its location was used for the storage of gasoline filters, oil, and antifreeze in 55-gallon drums. The concern for this AOC was petroleum products in soils.	During the CS Addendum No. 1 field program, one soil gas sample was analyzed, and PCE was detected. One soil boring was drilled, and the sample collected from the surface to 1.5 feet bgs was analyzed for VOCs, SVOCs, PCBs, and metals. No VOCs or SVOCs of concern were detected. Detected metals were within background range, and no PCBs were detected. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 66.	Results of CS Addendum No. 1 (CDM, 1996a); BWFS (CDM, 2003)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 67 – Gasoline Dump Pits	AOC 67 comprised four gasoline dump pits that were reported to be associated with Building 763, two to the north of the hangar bays and two to the south of the hangar bays. The dump pits were identified in a 1944 aerial photograph; however, the history of their use is unknown.	During the CS Addendum No. 2 field program, 24 soil gas samples were collected from the location of the pits shown in aerial photographs. Several VOCs, including TCE, were detected at low concentrations. AOC 67 is adjacent to the Building 763 TCE source location, which was subjected to an SVE removal action. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is required for AOC 67.	Results of CS Addendum No. 2 (CDM, 1996b); BWFS (CDM, 2003)
AOC 68 – Building 620 Wash Pad	See AOC 59		
AOC 69 – Chemical Warfare Training Area	Early Norton AFB records indicate that chemical warfare training was conducted during the World War II era in an area that is now part of the eastern portion of the golf course. It is suspected that the area was used only during World War II because aerial photos taken during the early 1950s show no evidence of the training activity. The types and volumes of chemicals used for training are not known, but it is assumed that the chemicals were typical of the era. The concern for AOC 69 was residual chemical warfare agents in soils.	During the CS Addendum No. 2 field program, ten soil samples were collected from the former training area. The soil samples were analyzed for 16 chemicals related to warfare agents. Only two chemicals were detected: diisopropylmethylphosphonate and dimethylmethylphosphonate. Concentrations of both chemicals were below levels of concern. The Air Force concluded that contamination does not exceed residential PRGs (unrestricted land use), and no further action is recommended for AOC 69.	Results of CS Addendum No. 2 (CDM, 1996b); BWFS (CDM, 2003)
AOC 71 – IRP Site 9 Air Ducts	AOC 71 represented the exhaust air ducts that ventilated the former electroplating room within Building 763. The Electroplating Shop, also termed IRP Site 9, was identified as a TCE source location in the CBA OU ROD. The removal action called for excavation of contaminated soils, but not ducts within the room. The concern for the AOC was the buildup of plating waste, particularly chromium, within the ventilation ducts of the building.	During the IRP Site 9 removal action, the ducts were inspected and found to contain a buildup of plating materials. As part of the Site 9 removal action, the ducts were demolished and taken to a licensed waste disposal facility. This removal action eliminated any health threat that the chemical buildup in the ducts could pose to future workers within the former plating room of Building 763. The Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, which removed the contamination, and no further action is required for AOC 71.	Closure Building 658 and IRP Site 9 (Earth Tech, 1996a)

Table 2-1

Description of IRP Sites and Areas of Concern Identified for No Further Action

Site/AOC Name	Site Description	Site Activities and Conclusions	References
AOC 72 – Former Park and Wash Area for Aircraft Fueling Vehicles	AOC 72 was used for parking and washing of vehicles used to transport and transfer fuel to aircraft. Discoloration typical of a fuel spill was observed on the concrete pad of the washing facility. The concern for the AOC was the presence of fuel contamination in soil beneath the washing and storage areas.	During the CS Addendum No. 2 field program, ten soil gas samples were collected throughout the AOC 72 area. No COCs were detected. The Air Force concluded that there was no release of contamination, and no further action is required for AOC 72.	Results of CS Addendum No. 2 (CDM, 1996b)
AOC 73 – Explosive Ordnance Proficiency Training Range	AOC 73 was used for training exercises for individuals needing to maintain their military explosives handling certificates. Training exercises involved detonation of a small explosives device (less than 2.5 pounds) at a pit within a small circular sandbag barrier. The concern for the AOC was explosives waste in soils.	Because this AOC involved the investigation of explosives and explosives waste, the work was performed under the guidance of a separate work plan approved by the Air Force Safety Board. Fieldwork involved surveying the entire 600-foot-diameter range and the 10-foot-diameter demolition pit using geophysical equipment to locate buried metal debris. All metal debris was excavated to identify its origin. The majority of the metal objects were aircraft parts. No explosive waste material was identified. Soil samples from the demolition pit were collected and analyzed for explosive chemical residues. No chemicals were detected. Based on the results of the site clearance activities, the report for AOC 73 has been cleared. The Air Force concluded that all contamination in excess of residential PRGs was addressed by the removal action, which removed contamination, and no further action is required for AOC 73.	WP EOD Clearance, AOC 73 (CDM and Applied Technology Group, 1996); EOD Proficiency Training Range (AOC 73) Clearance Report (CDM and Applied Technology Group, 1997)

Notes: (1) No release of contamination = no contaminants of concern were detected.
(2) Removal action removed contamination = contamination was removed to below screening or background levels.
(3) Contamination does not exceed residential PRGs (unrestricted land use) = contamination was below screening or background levels.

Conceptual Site Model
Norton ROD

Figure 2-2

the former Norton AFB. The HHRA is based upon the data presented in the site summaries in Section 2.5. The HHRA was performed only for sites with residual soil contaminant concentrations in excess of residential preliminary remediation goals (PRGs) and for groundwater concentrations in excess of the maximum contaminant level (MCL). The sites included in the HHRA are IRP Sites 1, 5, 7, 10, 12, 13, and 19; AOCs 4, 18, 33, 39, 40, and 70; the SAR; and the Building 752 exterior. Human health risks associated with indoor air inhalation at AOCs 12/13, 18, 23, 31, 33, 34, 35, 45, and 60 were also evaluated.

2.3.1.1 Identification of Chemicals of Concern

The BWFS used the U.S. EPA Region IX 2000 residential PRGs as a screening tool to determine whether a site requires a risk evaluation and to identify COCs at each site. U.S. EPA Region IX 2000 residential PRGs are listed on Table 2-2 for the Norton AFB COCs. Site-specific COCs, the range of detected concentrations, and the frequency of detection for each COC are provided in the site summaries in Section 2.5. Sites addressed in the HHRA have at least one chemical present at a concentration that exceeds a residential PRG, or exceeds the established background concentration in the case of metals. Background concentrations of metals for Norton AFB are listed on Table 2-3, and a detailed discussion of the criteria used to establish them are included in the RI. If no chemical exceeded a residential PRG (or background for metals) at a site, then the site was determined not to pose an adverse risk to human health and was eliminated from consideration in the risk assessment. If any chemical was detected above residential PRGs at a site, then all chemicals with a detected concentration within 1/100th of their respective PRGs were designated as COCs. The exception to this consideration is for metals. Any metal detected at a concentration below background is not considered to be a COC.

2.3.1.2 Exposure Assessment

Exposure assessment is the determination of the magnitude, frequency, duration, and route of exposure. Populations that currently or potentially may contact chemicals at Norton AFB were identified along with potential routes of exposure (contact with a chemical). Magnitude is determined by estimating the amount, or concentration, of the chemical at the point of contact over a specified time period, or exposure duration, as well as intake, or dose, of the chemical.

Table 2-2

Former Norton AFB BWFS Contaminants of Concern and Soil Preliminary Remediation Goals[1] Unrestricted Land Use Scenario

Contaminant of Concern[2]	Residential Soil Preliminary Remediation Goal (mg/kg)	Contaminant of Concern[2]	Residential Soil Preliminary Remediation Goal (mg/kg)
Benzene	0.65	PCBs	0.022
Chlorobenzene	150	Dioxins/Furans	0.0000039

Zinc	51.4-125	115.0	10.2-102	82.0

Notes:

[1] Data Qualifiers: B – Reported value was obtained from a reading that was less than the Contract Required Reporting limit, but greater than or equal to the instrument detection limit.
N – Spiked sample recovery was not within control limits.
U – Element was analyzed for, but not detected. The numerical value is the detection limit.
W – Post-digestion spike for Furnace Atomic Absorption analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.

[2] Developed from 50% of detection limit values.

UCL = upper confidence limit

All concentrations are milligrams per kilogram (mg/kg)

The exposure scenarios addressed in the BWFS HHRA include current land use as commercial/industrial, future land use as commercial/industrial, and future land use as unrestricted. The potential receptors evaluated for each site include hypothetical future residents and current and future commercial/industrial workers. The potential receptors were selected based on the anticipated current and future land uses. While the anticipated current and future land uses at Norton AFB are commercial and/or industrial, the BWFS evaluated the unrestricted land-use scenario to assess whether restrictions to land usage are necessary. Receptors such as visitors (golfers), utility workers, or other short-term construction workers were not evaluated because they would only be present intermittently. The residual soil concentrations do not pose an acute exposure risk, and the visitors will not have a higher degree of exposure than current workers, future industrial workers, or future residents.

For an exposure pathway to be complete, a source, a mechanism of contaminant release, a transport medium, a potential receptor, and an exposure route must be present. Potential exposure to soils was considered within a conservative depth range of 0 to 2 feet bgs for surface soils, and 0 to 20 feet bgs for sites with subsurface soil contamination. The exposure pathways that were considered in the BWFS HHRA were incidental soil ingestion, dermal contact with contaminants in soil, inhalation of soil particulates, inhalation of volatiles emitted from soil, ingestion of groundwater, dermal adsorption of groundwater during bathing, and inhalation of volatiles during household uses of groundwater.

The exposure point concentration is defined as the average concentration contacted at the exposure point(s) over the duration of the exposure period. Exposure point concentrations for soil were designated based upon the 95 percent upper confidence limit (UCL^{95}) of the mean concentration for each COC, consistent with the U.S. EPA's 1998 *Risk Assessment Guidance for Superfund*. Groundwater exposure point concentrations were calculated using the maximum concentration of each COC reported in April 1998.

Dose estimates were calculated for each COC and exposure pathway using exposure factors associated with the reasonable maximum exposure scenario. Dose is defined as the average amount of chemical systemically absorbed by the body over a given period of time. For noncarcinogenic effects, the dose is averaged over the period of exposure and is referred to as the

average daily dose (ADD). For carcinogenic effects, the dose is averaged over a 70-year lifetime and is referred to as the lifetime average daily dose (LADD).

Details regarding the computation of exposure point concentrations and dose estimates are provided in the BWFS HHRA.

2.3.1.3 Toxicity Assessment

The dose-response (i.e., toxicity) assessment is the process of characterizing the relationship between the dose of a chemical and the anticipated incidence of adverse health effect (i.e., response) in an exposed population. U.S. EPA uses dose-response data to establish "maximally acceptable" levels of daily human exposure for noncarcinogenic chemicals. Carcinogenic potency is a measure of the relationship between dose and cancer incidence. The following sections discuss the noncarcinogenic and carcinogenic risk criteria for the COCs.

Reference Dose (Noncarcinogenic Effects)

Oral and inhalation reference doses (RfDs) are derived from human or animal studies in which a threshold effect or no-effect level has been identified. An RfD is an average daily dose that is not expected to cause adverse health effects in even the most sensitive of individuals. U.S. EPA's, and where more restrictive DTSC's, RfDs were used to evaluate the noncarcinogenic health hazards. The RfDs used were taken from the U.S. EPA's *Integrated Risk Information System* (IRIS) and California EPA's *Cancer Potency Values* (2001) and *Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values* (2002). For values not found in IRIS or DTSC's website, data from the *Health Effects Assessment Summary Tables FY97 Update* (U.S. EPA 540-097-036) were used. For the BWFS HHRA and consistent with U.S. EPA guidance, the oral RfD was used to represent the dermal RfD. Where inhalation toxicity criteria were not available, oral toxicity criteria were used. The non-cancer toxicity data used in the risk assessment for soil and groundwater oral/dermal exposure and inhalation are presented in Tables 2-4 and 2-5, respectively. Because carcinogens also commonly evoke noncarcinogenic effects, RfDs are sought for all chemicals carried through the risk assessment, including carcinogens. When RfDs were not available, surrogate values were used as appropriate.

Cancer Slope Factors

The cancer slope factor (SF) is a toxicity value that quantitatively defines the relationship between chemical dose and cancer response rate. The chemical-specific SF represents the upper bound estimate of the probability of an individual contracting cancer, per unit intake of chemical, over a 70-year lifetime. U.S. EPA toxicity criteria, or DTSC criteria where more restrictive, were used to evaluate carcinogenic responses to site-related chemicals. The primary source for the U.S. EPA toxicity criteria was the IRIS database. The cancer toxicity data used in the BWFS HHRA for oral/dermal exposure and inhalation are presented in Tables 2-6 and 2-7, respectively. Lead, considered by U.S. EPA as a probable human carcinogen, does not have an SF. Lead is addressed in the BWFS HHRA using blood chemistry modeling.

Evaluation of PAHs and Dioxins/Furans

Polynuclear aromatic hydrocarbons (PAHs) and dioxins/furans were evaluated using toxic equivalency factors (TEFs) and potency equivalency factors (PEFs). PEFs developed by DTSC were applied to carcinogenic PAHs; TEFs as published by the World Health Organization (van Leeuwen, 1997) and shown in Table 2-8 were applied to dioxins and furans.

For dioxins, a total 2,3,7,8-tetrachlorodibenzo-p-dioxin- (TCDD-) equivalent concentration was estimated by multiplying the concentration of each compound by its TEF. The sum of these TCDD-equivalent concentrations results in a total TCDD-equivalent concentration that is used to estimate total cancer risk from potential exposure to dioxins. The UCL^{95}s were calculated using the total 2,3,7,8-TCDD-equivalent concentrations. For PAHs classified by U.S. EPA as potential carcinogens, the PEF of each PAH was multiplied by the SF for benzo(a)pyrene. The resulting relative potency factor was then used to estimate the cancer risk for those PAHs classified as potential carcinogens.

2.3.1.4 Risk Characterization

For carcinogens, risks are generally expressed as the incremental probability of an individual developing cancer over a lifetime as a result of exposure to the carcinogen. Excess cancer risk is calculated from the following equation:

$$\text{Risk} = \text{LADD} \times \text{SF}$$

These risks are probabilities of an individual developing cancer that usually are expressed in scientific notation (e.g., 2×10^{-5}). An excess lifetime cancer risk of 1×10^{-6} indicates that an individual experiencing the reasonable maximum exposure estimate has a 1 in 1,000,000 chance

of developing cancer as a result of site-related exposure. This is referred to as an "excess lifetime cancer risk" because it would be in addition to the risks that cancer individuals face from other causes, such as smoking or exposure to too much sun. The chance of an individual developing cancer from all other causes has been estimated to be as high as 1 in 3. U.S. EPA's generally acceptable risk range for site-related exposure is 1×10^{-4} to 10^{-6} with a hazard index (HI) <1. Specific chemicals at a site that contributed equal to or greater than 1×10^{-6} cancer risk, as determined by comparison to U.S. EPA PRGs, were identified as risk-based COCs that required evaluation in the BWFS.

The potential for noncarcinogenic effects is evaluated by comparing an exposure level over a specified time period (e.g., lifetime) with an RfD derived for a similar exposure period. An RfD represents a level that an individual may be exposed to that is not expected to cause any deleterious effects. The ratio of exposure to toxicity is called a hazard quotient (HQ). An HQ <1 indicates that a receptor's dose of a single contaminant is less than the RfD and that toxic noncarcinogenic effects from that chemical are unlikely. The HI is generated by adding the HQs for all COCs that affect the same target organ (e.g., liver) or act through the same mechanism of action within a medium or across all media to which a given individual may reasonably be exposed. An HI less than 1 indicates that, based on the sum of all HQs from different contaminants and exposure routes, toxic noncarcinogenic effects from all contaminants are unlikely. An HI greater than 1 indicates that site-related exposures may present a risk to human health. The HQ is calculated as follows:

Non-cancer HQ = ADD/RfD

ADD and RfD are expressed in the same units (milligrams per kilogram [mg/kg] of body weight per day [mg/kg-day]) and represent the same exposure period (i.e., chronic, sub-chronic, or short term). Specific chemicals at a site that contributed an HI of equal to or greater than 1 were identified as risk-based COCs that required evaluation in the BWFS.

2.3.1.5 Uncertainty Analysis

Risk characterization includes sources of uncertainty inherent to the risk assessment process. The uncertainties are due to limitations in the available site data and methods used to quantify

risk. The uncertainties associated with the BWFS HHRA result from limitations in the available information and methods for identification of COCs, exposure assessment, toxicity assessment, and risk characterization. Limitations in sampling locations, depth, and frequency also result in uncertainty. The current and planned land uses at Norton AFB include aviation support, industrial activity, and commercial usage. Hence, the use of the unrestricted land-use scenario likely overestimates risk associated with actual human exposures.

Toxicity values are typically derived from studies performed on laboratory animals; thus, uncertainty results from potential differences between laboratory animals and humans in the target organs affected, dose-response relationship, and absorption and metabolism. Since lead does not have a cancer SF and cannot be included in the computation of carcinogenic risk, computed cancer risk may be underestimated. Summing the risk or hazard for several COCs across multiple pathways assumes no synergistic or antagonistic chemical interactions. Additionally, the computation of indoor air risk assumed building dimensions much smaller than are likely, thus resulting in an overestimate of risk due to indoor air inhalation.

Because of the large number of uncertainties in the risk assessment process, results may be overestimated or underestimated by several orders of magnitude. However, since assumptions used in risk assessment typically err on the conservative (i.e., health-protective) side, estimates of risk are usually overestimated. A detailed description of uncertainties associated with the risk computations, including site-specific considerations, are provided in the BWFS.

2.3.2 Ecological Risk Assessment

A basewide ecological risk assessment (ERA) for the former Norton AFB was completed in 1997 (CDM, 1998a). The ERA evaluated all IRP sites within or adjacent to areas of the base containing native or relatively undisturbed vegetation. Included in the ERA were several golf course ponds that once provided unique habitat to terrestrial and aquatic species. Urbanized, industrialized, or highly disturbed areas (e.g., mowed areas adjacent to the flight line and areas vegetated with non-native weeds) were not included. The results of the 1997 ERA concluded that IRP Sites 1, 2, 5, 8, 10, and 13, and contaminants found in the sediments of the unlined golf course ponds posed a potential risk to ecological receptors (plants and animals). Based on these

conclusions, removal actions were performed at the identified sites. The removal actions and the closure (capping) of the base landfill (Site 2) eliminated or reduced the risks at all of the locations. The risk at the golf course ponds was eliminated through removal of the pond sediment and cessation of use of the ornamental ponds.

Following completion of the 1997 basewide ERA, dioxin contamination was found in soil at IRP Site 10 (Section 2.5.6), necessitating reevaluation of the ecological risks at this site. The vegetation immediately to the south of Site 10 is characterized by a desert plant community, termed riversidean alluvial sage scrub. The riversidean alluvial sage scrub vegetation provides habitat for a variety of plants and animals, including two endangered species, the San Bernardino Merriam's kangaroo rat and the Santa Ana River woolly star. Dioxins were established as the only COC at Site 10 for the ERA presented in the BWFS. Other contaminants known to be present at Site 10, including metals, polychlorinated biphenyls (PCBs), pesticides, and PAHs were eliminated as COCs since they were detected at minimal concentrations in the area of native habitat. The ERA considered three primary pathways for ecological exposure to dioxins: soil ingestion, plant matter ingestion, and insect ingestion. Since the ERA concluded that plant uptake of dioxins from soil is minimal, the kangaroo rat was the only potential receptor quantitatively evaluated. The ERA concluded that current concentrations of dioxins at Site 10 pose a potential adverse threat to ecological receptors; however, cleanup of dioxins to levels established as protective of human health would also be protective to ecological receptors.

2.3.3 Basis for Remedial Action Objectives

Remedial action objectives (RAOs) for the former Norton AFB are based on the protection of human health and the environment. Implementation of the selected remedies will either remove the source of, or prevent exposure to, unacceptable risk to human health and the environment. Site-specific RAOs are presented in Section 2.5.

2.3.4 Description of Alternatives

An evaluation of remedial alternatives was performed during the BWFS for sites with contaminants at levels posing potential unacceptable risk to human health. Remedial alternatives

considered during the BWFS are described below and include NFA, removal, containment, ICs, and monitoring.

2.3.4.1 No Further Action

No remedy is implemented, and the current status of the various sites would remain unchanged relative to contaminant concentrations. Any reduction in the contamination would be through unaided natural attenuation processes. Exposure to contaminated soils would be possible for any future land pattern and use change.

2.3.4.2 Institutional Controls

ICs are non-engineering, non-technical mechanisms used to reduce or prevent human exposure to contaminants. ICs are being applied to four former Norton AFB sites: IRP Sites 2, 5, and 19 and the SAR. Figure 2-3 shows the locations of these sites and summarizes the ICs for each. AOC 4 is an NFA site. However, it is shown on the figure because DTSC may pursue a SLUC.

Specific language is included in this ROD regarding implementation, monitoring, reporting, and enforcement of the selected ICs. Therefore, compliance with the terms of this ROD will be protective of human health and the environment. Because the restrictions are specifically described in Section 2.5 and the means for implementing the restrictions are detailed herein, it is not necessary for the Air Force to submit any new post-ROD, IC implementation documents, such as a Land Use Control Implementation Plan (LUCIP), new operation and maintenance (O&M) plans or RA work plans.

The IC alternatives include various enforceable use restrictions and land use controls on the use of the property. The Air Force is ultimately responsible for implementing, maintaining, and monitoring the remedial actions (including ICs) before and after property transfer. The Air Force will exercise this responsibility in accordance with CERCLA and the NCP.

Meeting RAOs shall be the primary and fundamental indicator of IC performance, the ultimate aim of which is to protect human health and the environment. Performance measures for ICs are the RAOs plus the actions necessary to achieve those objectives. It is anticipated that successful.

- Prohibit residential use, including hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children and prohibit activities that limit access to the site for inspections.
Site 19, IC Remedy
- Prohibit residential use, including hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.
- Prohibit activities that limit access to the site for inspections.
Site 2, IC Remedy
- Prohibit residential use, including hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.
- Prohibit construction, excavation, drilling, grading, removal, trenching, filling earth movement, mining, planting that would disturb the soil or the landfill cover, including the vegetative cap, or the injection or release of water or other fluids except for the purpose of monitoring groundwater or landfill gas.
- Prohibit construction, excavation, drilling, grading, removal, trenching, filling earth movement, mining, planting that would result in contact with landfill waste materials.
- Prohibit activities that would cause disturbance or removal of fencing or signs intended to exclude the public from the landfill.
- Prohibit activities that would cause the surface application of water (e.g., irrigation) to the extent that the integrity of the landfill is impacted; or the injection of water of other fluids that might affect groundwater flow direction.
- Prohibit activities that would cause disturbance of any landfill equipment or systems, including the groundwater monitoring systems, and settlement monuments, or that could affect the drainage, sub-drainage, or erosion controls for the landfill cover.
- Prohibit activities that limit access to any landfill equipment and systems, including the groundwater monitoring systems, settlement monuments, or the drainage, sub-drainage, or erosion controls for the landfill cover.
SAR, IC Remedy
- Prohibit residential use, including hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.
- Prohibit activities that limit access to the site for inspections.
Site 5, IC Remedy
- Prohibit residential use, including hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.
- Prohibit activities that limit access to the site for inspections.

Figure 2-3

implementation, operation, maintenance, and completion of these measures will achieve protection of human health and the environment and compliance with all legal requirements.

The Air Force may contractually arrange for third parties to perform any and all of the actions associated with ICs, although the Air Force is ultimately responsible under CERCLA for the successful implementation of the ICs, including monitoring, maintenance, and review of ICs. Maintenance, monitoring, and other controls as established in accordance with this ROD and the appropriate transfer documents will be continued until the ICs are no longer necessary as specified within the description of alternatives for affected sites in the Basewide OU or they are modified due to reduction in toxicity or potential exposure to contamination. Land use controls shall be maintained until the concentration of hazardous substances in the soil and groundwater are at such levels as to allow for unrestricted use and exposure.

Deed Restriction and Reservation of Access

The federal deed(s) containing IRP Sites 2, 5, and 19 and the SAR will include a description of the residual contamination on the property, consistent with the Air Force's obligations under CERCLA Section 120(h) and the specific restriction set forth in Section 2.5 for each site under "Description of Selected Remedy." The IC, in the form of a deed restriction, is an "environmental restriction" under California Civil Code Section 1471. The deed(s) will contain appropriate provisions to ensure that the restrictions continue to run with the land, as provided in California Civil Code Section 1471, and will include a legal description for each site (IRP Sites 2, 5, and 19 and the SAR).

The Air Force and regulatory agencies may conduct inspections of the ICs at Sites 2, 5, and 19 and the SAR. The deed(s) will also contain a reservation of access to the property for the Air Force, U.S. EPA, and DTSC, and their respective officials, agents, employees, contractors, and subcontractors for purposes consistent with the Air Force IRP or the FFA (and the Air Force will provide such access to regulatory agencies prior to transfer).

The environmental restriction is the basis for part of the CERCLA 120(h)(3) covenant that the United States is required to include in the deed for any property that has had hazardous

substances stored for 1 year or more or known to have been released or disposed of on the property. During the time between adoption of this ROD and deeding the property, appropriate restrictions are implemented at IRP Sites 2, 5, and 19 and the SAR by the lease between the Air Force and the IVDA or SBIAA.

Notice of Institutional Controls

The Air Force will include the specific deed restriction language set forth in this ROD in the deed(s) for the parcels that include IRP Sites 2, 5, and 19 and the SAR and will provide a copy of the deed to the regulatory agencies as soon as practicable after transfer of fee title. The Air Force will provide information to the property owners regarding the necessary ICs in the draft deed(s). The signed deed(s) will also include the specific land use restriction(s) as well as a condition that the transferee execute and record an SLUC, within 10 days of transfer, to address any state obligations pursuant to State law, including 22 CCR, Section 67391.1. The Air Force will ensure that the transferee has met this condition. The information will also be communicated to appropriate state and local agencies with authority regarding any of the activities or entities addressed in the controls to ensure that such agencies can factor the information into their oversight, approval, and decision-making activities.

Prior to conveyance of IRP Sites 2, 5, and 19 and the SAR, U.S. EPA and DTSC representatives will be given reasonable opportunity to review and comment on the applicable deed language described in this section and associated rights of entry for DTSC and U.S. EPA for purposes of IC oversight and enforcement.

Annual Evaluations/Monitoring

Prior to property transfer, the Air Force will conduct annual monitoring, provide annual reports and undertake prompt action to address activity that is inconsistent with the IC objectives or use restrictions, or any action that may interfere with the effectiveness of the ICs. The monitoring results will be included in a separate report or as a section of another environmental report, if appropriate, and provided to the U.S. EPA and DTSC. The annual monitoring reports will be used in preparation of the Five Year Review to evaluate the effectiveness of the remedy. Prior to

transfer, the annual monitoring report submitted to the regulatory agencies by the Air Force will evaluate the status of the ICs and how any IC deficiencies or inconsistent uses have been addressed.

Upon the effective date of property conveyance, the transferee[1] or subsequent property owner(s) will conduct annual physical inspections of each site to confirm continued compliance with all IC objectives unless and until the ICs at Sites 2, 5, and 19 and the SAR are terminated. The transferee or subsequent property owner(s) will provide to the Air Force, U.S. EPA, and DTSC an annual monitoring report on the status of ICs and how any IC deficiencies or inconsistent uses have been addressed. The Air Force will place these transferee obligations in the transfer documentation.

The 5-year review reports conducted by the Air Force will also address whether the ICs in the ROD were inserted in the deed(s), if property was transferred during the period covered, whether the owners and State and local agencies were notified of the ICs affecting the property, and whether use of the property has conformed to such ICs. Five-year review reports will make recommendations on the continuation, modification, or elimination of annual reports and IC monitoring frequencies. Five-year review reports are submitted by the Air Force to the regulatory agencies for review and comment.

Although the Air Force is transferring procedural responsibilities to the transferee and its successors by provisions to be included in the deed(s) transferring title to IRP Sites 2, 5, and 19 and the SAR and may contractually arrange for third parties to perform any and all of the actions associated with ICs, the Air Force is ultimately responsible for the remedy.

Response to Violations

Prior to property transfer, the Air Force will notify EPA and DTSC as soon as practicable but no longer than 10 days after discovery of any activity that is inconsistent with the IC objectives or

[1] or other entity accepting such obligations (which may include, without limitation, subsequent transferees)

use restrictions, or any other action that may interfere with the effectiveness of the ICs. The Air Force will notify U.S. EPA and DTSC regarding how the Air Force has addressed or will address the breach within 10 days of sending U.S. EPA and DTSC notification of the breach.

Post-transfer, if the transferee fails to satisfy its obligations pursuant to the SLUC, DTSC may enforce such obligations against the transferee. If there is failure of the selected remedy or a violation of selected remedy obligations (for example, an activity inconsistent with the IC objective or use restriction, or any action that may interfere with the effectiveness of the ICs), DTSC will notify the Air Force and U.S. EPA in writing of such failure as soon as practicable (but no longer than 14 days) upon discovery of the inconsistent activity or action that interferes with the effectiveness of the ICs, and initially seek corrective action or other recourse from the transferee. Within 21 days following DTSC's notification, the Parties shall confer to discuss re-implementation of the selected remedy or other necessary remedial actions to address the breach of any IC. Once DTSC reports that the transferee is unwilling or unable to undertake the remedial actions, the Air Force will within 10 days inform the other Parties of measures it will take to address the breach.

Approval of Land Use Modification

Prior to transfer, the Air Force shall not modify or terminate land use controls, or implementation actions that are part of the selected remedy without approval by U.S. EPA and DTSC. The Air Force shall seek prior concurrence before any anticipated action that may disrupt the effectiveness of the land use control or any action that may alter or negate the need for land use controls.

Any grantee of property constrained by ICs imposed through their transfer document(s) may request modification or termination of the ICs. Modification or termination of these ICs, except the SLUC (discussed below), requires Air Force, U.S. EPA, and DTSC approval.

State Land Use Covenant (SLUC) Modification

Any modification or termination of the SLUC must be undertaken in accordance with State law and will be the responsibility of the transferee or then-current owner or operator.

2.3.4.3 Containment

Containment alternatives reduce or prevent contaminant migration and exposure routes using a physical barrier. The contaminants are not changed through treatment, nor are the volumes of contaminants reduced, except through unaided natural attenuation processes. Examples of containment technologies are surface controls, such as covering/capping, and subsurface barriers, such as grout curtains. The landfill cap at IRP Site 2 is an example of contaminant containment.

2.3.4.4 Removal

Removal consists of any process whereby the contaminant is removed from the site. Treatment of the contaminant by physical, chemical, or thermal means, may or may not be performed, depending on the disposal requirements for the removed media. Examples of removal actions include soil excavation, groundwater extraction, and soil gas extraction. Treatment technologies are used with a removal action, as appropriate, prior to disposal of any media or residuals.

2.3.5 Evaluation Criteria

Alternatives considered for cleaning up Superfund sites are required to be compared using remedial evaluation criteria found in the NCP. These nine criteria are subdivided into three groups: threshold criteria, balancing criteria, and modifying criteria. Threshold and balancing criteria were evaluated during the BWFS. Modifying criteria were considered after comments on the Basewide Proposed Plan (BWPP) were received and given an appropriate response.

THRESHOLD CRITERIA. In order to satisfy the threshold criteria, the remedial alternative must:

- Be protective of human health and the environment.
- Comply with ARARs.

BALANCING CRITERIA. As several different remedial alternatives may satisfy the threshold criteria, the selected alternatives are then compared, based on the following balancing criteria:

- Long-term effectiveness and permanence
- Reduction of contaminant toxicity, mobility, or volume (TMV) through treatment
- Short-term effectiveness
- Implementability
- Cost.

Implementing the balancing criteria will generally indicate a technically and economically preferable alternative. However, in many cases the apparent preference for one alternative over another may not be significant. Also, the most technically and economically preferred alternative may have other drawbacks. In these instances, modifying criteria are used to distinguish among alternatives that are otherwise closely ranked.

MODIFYING CRITERIA. The modifying criteria include:

- State acceptance
- Community acceptance.

A description of each criterion, and a comparison of remedial alternatives based on compliance with the criterion, are provided in the following subsections. The detailed comparative analysis of remedial alternatives is presented in the BWFS.

2.3.5.1 Overall Protection of Human Health and the Environment

Overall protection of human health and the environment addresses whether each alternative provides adequate protection of human health and the environment and describes how risks posed through each exposure pathway are eliminated, reduced, or controlled, through treatment, engineering controls, and/or ICs.

2.3.5.2 Compliance with ARARs

Section 121(d) of CERCLA and NCP §300.430(f)(1)(ii)(B) require that RAs at CERCLA sites at least attain legally Federal and State ARARs, unless such ARARs are waived under CERCLA Section 121(d)(4). Compliance with ARARs addresses whether an alternative will meet all of the Federal and State ARARs or provides a basis for invoking a waiver.

Applicable requirements are those cleanup standards, standards of control, and other substantive requirements, criteria, or limitations promulgated under Federal or State environmental or facility siting laws that specifically address a hazardous substance, pollutant, contaminant, RA, location, or other circumstance. Only those State standards that are identified by a state in a timely manner and that are more stringent than Federal requirements may be applicable.

Relevant and appropriate requirements are those cleanup standards, standards of control, and other substantive requirements, criteria, or limitations promulgated under Federal or State environmental or facility siting laws that, while not "applicable" to a hazardous substance, pollutant, contaminant, RA, location, or other circumstance at a CERCLA site, address problems or situations sufficiently similar to those encountered at the CERCLA site so that their use is well suited to the particular site. Only those State standards that are identified in a timely manner and are more stringent than Federal requirements may be considered relevant and appropriate.

2.3.5.3 Long-Term Effectiveness and Permanence

Long-term effectiveness and permanence refers to expected residual risk and the effectiveness of an alternative to maintain reliable protection of human health and the environment over time after the alternative has been implemented. This criterion includes the consideration of residual risk following remedy implementation and the adequacy and reliability of controls.

2.3.5.4 Reduction of Toxicity, Mobility, or Volume through Treatment

Reduction of TMV through treatment refers to the anticipated performance of treatment technologies that may be included as a component of the remedy.

2.3.5.5 Short-Term Effectiveness

Short-term effectiveness addresses the period of time needed to implement the remedy, and any adverse impacts that may be posed to workers, the community, or the environment during remedy implementation until cleanup levels are achieved.

2.3.5.6 Implementability

Implementability addresses the technical and administrative feasibility of a remedy from design through construction and operation. Factors such as availability of services and materials, administrative practicability, and coordination with governmental agencies are also considered.

2.3.5.7 Cost

The NCP specifies that cost be considered during evaluation of remedial alternatives. Estimated costs are summarized in Table 2-9.

Table 2-9

Comparison of Costs by Alternative by Site

Site/AOC	Depth Interval (ft bgs)	Affected Area (acres)	Volume of Affected Area (cubic yd)	Alternative 1		Alternative 2	Alternative 3	Alternative 4		
				No Action	Monitoring[1]	Institutional Controls[2]	Containment	4a Removal (Soils)	4b Removal (Perched Groundwater)	4c Removal (Soil Gas)
Site 1	29 to 30	0.1	15,300	NA	$443,000	$72,100	NA	$910,000	$285,000	NA
Site 2	10 to 40	31	NA[6]	NA	$452,000	$72,100	Action complete	NA	NA	Ongoing O&M
Site 5	5 to 15	1.2	30,000	NA	NA	$72,100	NA	$3,840,000	NA	NA
Small Arms Range	0 to 5	0.1	1,600	NA	NA	$72,100	$72,100	$360,000	NA	NA
Site 7	0 to 2	0.5	350	NA	NA	$72,100	NA	$60,000	NA	NA
Site 10	0 to 2	6	20,000	NA	NA	$72,100	$205,000	$1,900,000	NA	NA

NBA PCE Plume	upper aquifer	unknown	upper aquifer	NA	[3]	$72,000	NA	NA	NA	NA

Notes:
[1] Costs are present worth costs based on 30 years of monitoring
[2] Costs are present worth for discount rate of 7 percent, 30 years - for four sites.
[3] Any sampling of the NBA PCE plume will be conducted as part of the Comprehensive Basewide Groundwater Monitoring Program.
NA = Not applicable to site or AOC
NBA = Northeast Base Area
PCE = tetrachloroethene
VOC = volatile organic compound

2.3.5.8 State Agency Acceptance

The Air Force worked closely with the California EPA DTSC to ensure that the remedies presented in the BWPP met with their approval.

2.3.5.9 Community Acceptance

The community accepted the BWPP as written (see Section 4 and Appendix B). The community participation program for former Norton AFB is described in Section 2.4.

2.4 COMMUNITY PARTICIPATION

The Community Relations Plan (CRP) for Norton AFB was completed in April 1990 and updated in 1996 and in 1999. Consistent with the CRP, the Air Force established a Restoration Advisory Board (RAB) composed of U.S. EPA, DTSC, RWQCB, the Air Force, San Bernardino County, local representatives, and members of the community. The RAB met on a regular basis to provide the community representatives with information on recent events. The RAB adjourned in 1998. The Air Force has held annual public forums beginning in 1999, and continues to publish and distribute newsletters and fact sheets about the former Norton AFB to inform the community of recent activities.

After completion of the BWFS, the BWPP and supplement (USAF, 2004a, b) were submitted for a 30-day public comment period on July 28, 2004, and a public hearing was held at the San Bernardino City Council Chambers on August 11, 2004. The comment period was extended to September 10, 2004, to give the public an opportunity to comment on a supplemental packet mailed on August 5, 2004. The BWPP and supplemental packet provides a brief overview of the information contained in the BWFS and lists the preferred remedial alternative for each site included in this ROD. Only one response/comment was received during the public hearing and comment period for the BWPP and that was in support of the BWPP (see Responsiveness Summary, Section 4).

This Basewide ROD presents the selected remedies for 21 of the 22 IRP sites, all of the 73 AOCs, the SAR, Building 752, and groundwater contamination in the NBA at the former Norton AFB in San Bernardino County, California. The remedies were chosen in accordance with CERCLA, as amended by SARA and the NCP. The remedial decisions are based on the

BWFS (CDM, 2003) and other associated documentation included in the Norton AFB Administrative Record. Publicly accessible copies of the Administrative Record are available at www.afrpa.hq.af.mil/mcclellan and the Norman Feldheym Central Library in San Bernardino, California. The availability of the Administrative Record was indicated to the public in the BWPP. The Administrative Record index is provided in Appendix A. The public participation requirements of CERCLA Sections 113(K)(2)(B)(i-v) and 117 have been substantively satisfied.

2.5 SITE-SPECIFIC EVALUATIONS

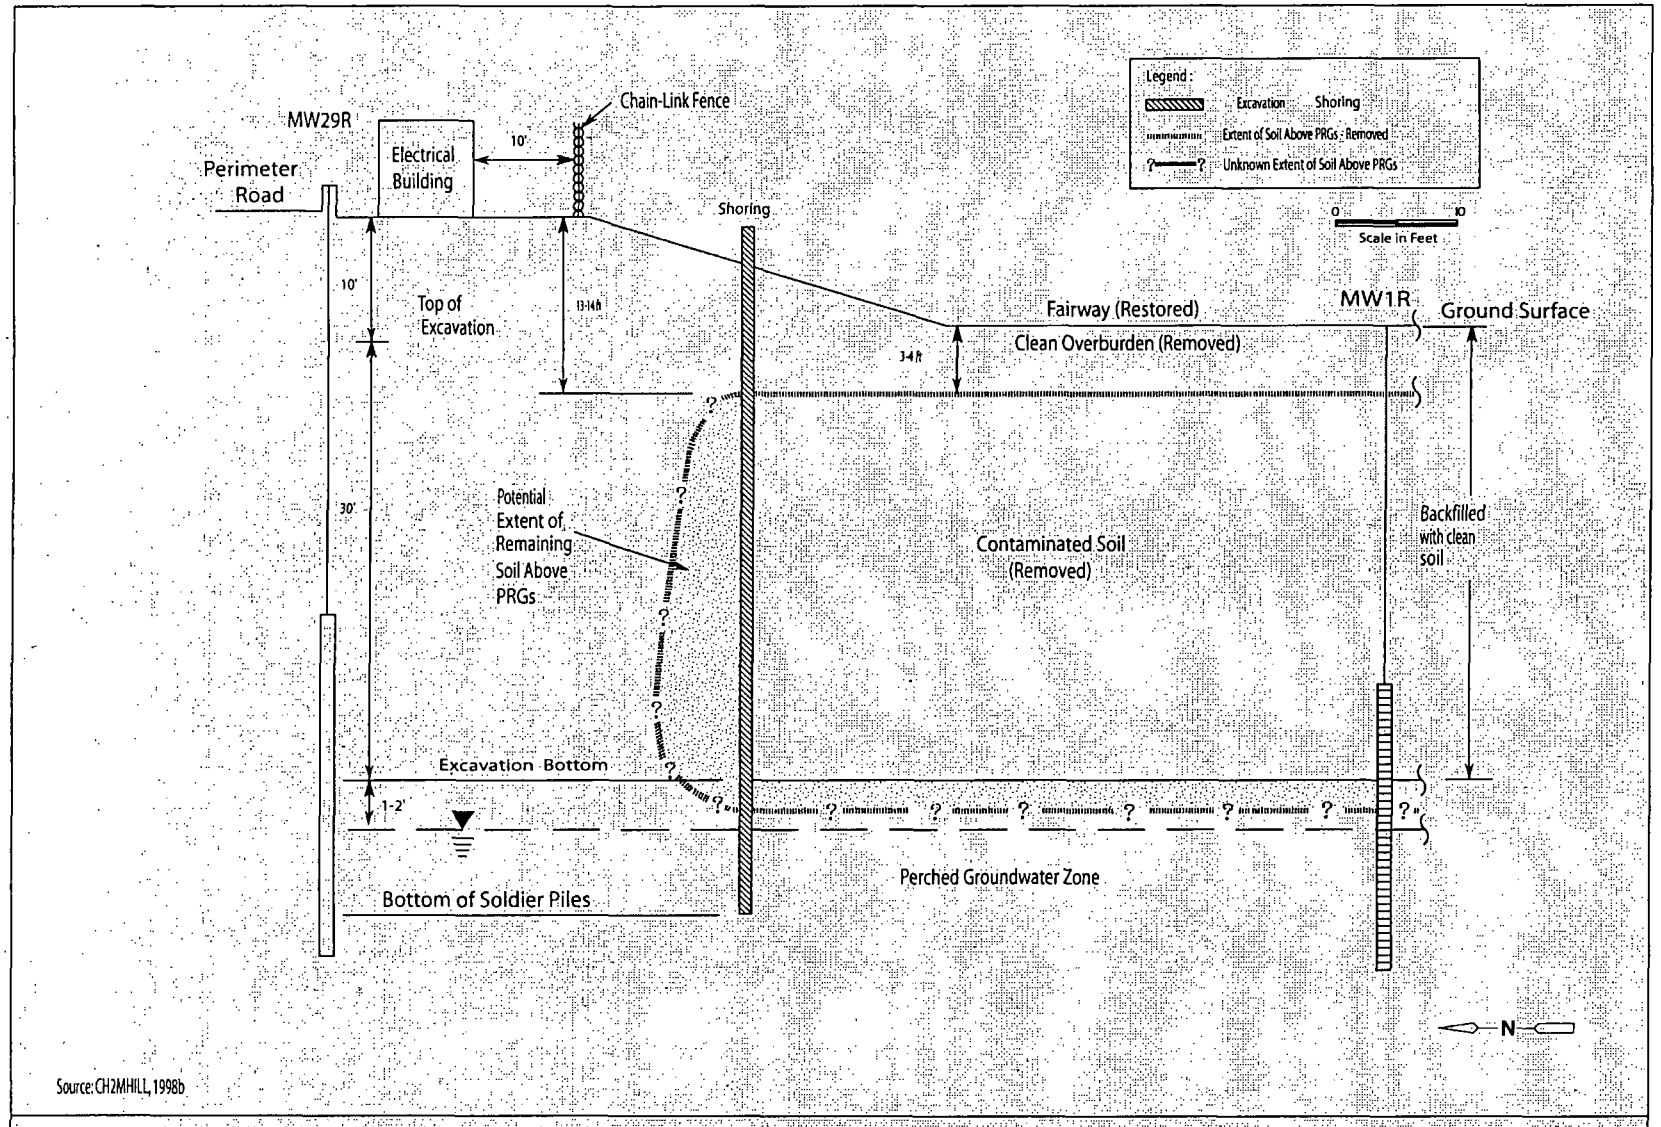
This section provides the generalized basewide conceptual model for Norton AFB and specific information pertaining to sites evaluated in the BWFS (CDM, 2003).

2.5.1 IRP Site 1 – Industrial Waste Lagoons

2.5.1.1 Site History

IRP Site 1 is in the GCA and was the location of former unlined lagoons used from 1950 to 1960 for the disposal of liquid waste generated during aircraft repair. During the 1960s, a portion of the golf course was constructed over the site without removing all industrial waste. The RI identified soils contaminated with paints, solvents, oil, fuels, and solids that had been washed into the industrial waste system. Chlorobenzene, 1,2-dichlorobenzene (DCB), and 1,4-DCB exceeded industrial PRGs.

An Engineering Evaluation/Cost Analysis (EE/CA) (CH2M Hill, 1996) identified removal of contaminated soil to a depth of approximately 30 feet bgs, backfilling with clean soil, and restoring the site as a portion of a fairway and green. A total of 20,325 tons of contaminated soil was excavated from an area of approximately 25,000 square feet, to the top of the perched-zone groundwater at a depth of approximately 29 feet bgs. The excavation was located next to a berm that supports the airfield perimeter road. Based on confirmation sampling results, the contamination extended beneath the perimeter road. For technical and implementability reasons, the deep and lateral contamination was not removed. The area of affected soil left in place covers approximately 3,800 square feet (CH2M Hill, 1998b). Residual contamination is located between 20 feet bgs to approximately 30 feet bgs (CH2M Hill, 1998b), and includes chlorobenzene, 1,2-DCB, 1,4-DCB, toluene, and xylene. Figure 2-4 is a cross-section of the site



NortonROD/003

CDM Federal Programs Corporation
A Subsidiary of Camp Dresser & McKee Inc.

CROSS-SECTION OF BURIED CONTAMINATION
IRP SITE 1
FORMER NORTON AIR FORCE BASE

Figure 2-4

showing the depth of contamination related to key site features. The removal action is described in the closure report for IRP Site 1 (CH2M Hill, 1998b).

Because soil contaminants were left in place and in contact with the perched-zone groundwater, monitoring wells were installed into the perched zone, one at the excavation site and another through the berm adjacent to the perimeter road. These wells are sampled for volatile organic compounds (VOCs) in accordance with the approved groundwater sampling plan to monitor the impact of the residual contaminants. The first sampling event was performed during October 1998 (CDM, 1999). The data show a downward trend in contaminant concentrations, and all COCs in perched-zone groundwater have been below MCLs since April 2002, and the upper aquifer has not been impacted (CDM, 2003).

2.5.1.2 Current and Potential Future Site Use

IRP Site 1 is part of the active golf course, and the property is currently zoned industrial/commercial by the city of San Bernardino. The projected long-term use of the site is expected to be commercial/industrial-related options for the property.

2.5.1.3 Summary of Site Risk

The BWFS concluded that residual contamination at IRP Site 1 does not pose unacceptable risk to human health due to its significant depth (approximately 29 feet bgs). Table 2-10 summarizes the BWFS risk analysis results. Additionally, as evidenced by groundwater sampling results, the residual contamination does not pose an adverse risk to groundwater quality.

2.5.1.4 Remedial Action Objectives

There are no RAOs at IRP Site 1 since there is no unacceptable risk to human health or the environment.

2.5.1.5 Analysis of Alternatives

The Air Force excavated and disposed contaminated soil off site. Residual soil contamination remains at a depth of approximately 29 feet bgs and in contact with perched-zone groundwater. Due to the depth of buried residual waste, there is no unacceptable risk to human health.

Table 2-10

Summary of Site 1 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	5 to 29	0.1	1.5×10^{-7}	0.0015	—[3]	Dichlorobenzenes	Acceptable risk under industrial reuse scenario
Unrestricted	5 to 29	0.1	4.4×10^{-7}	0.0094	—[3]	Dichlorobenzenes	Acceptable risk under the unrestricted land use scenario

Notes:

1 Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

2 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

3 Lead is not chemical of concern at IRP Site 1.

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

Additionally, all COCs in perched-zone groundwater have been below MCLs since April 2002, and the upper aquifer has not been impacted (CDM, 2003).

Alternative 1 (NFA) is protective of human health and groundwater, since there is no unacceptable risk to human health or groundwater posed by the residual contamination at IRP Site 1.

2.5.1.6 Description of Selected Remedy

The selected remedy for IRP Site 1 is NFA.

2.5.1.7 Summary of Rationale for the Selected Remedy

Contamination at Site 1 remains buried beneath the golf course fairway at depths greater than 20 feet bgs. The site is currently used as a fairway for the Palm Meadow's Golf Course. Projected long-term plans for the site are industrial/commercial-related activities, which are consistent with city of San Bernardino zoning. Groundwater data from quarterly sampling events demonstrate contaminant levels in the perched-zone groundwater below MCLs and no impact to the upper aquifer.

The concerns for the site include: (1) unrestricted soil excavation that could bring contaminated soil to the surface allowing for exposure; and (2) installation of an upper aquifer well through the perched zone that could potentially contaminate the upper aquifer. Under current and expected future land uses, there is little possibility for exposure to contaminated soil or perched-zone groundwater. The perched zone is not a viable drinking water source; contaminant concentrations are below MCLs and do not threaten upper aquifer groundwater quality. There is limited risk (with a combined adult/child excess cancer risk of 4.4×10^{-7}, and a child HI of 0.0094) because contaminants are buried greater than 20 feet bgs; the most highly contaminated soil is greater than 29 feet bgs. This depth is beyond the range of normal soil excavation. Site-specific conditions could further reduce any potential exposure to the soil contaminants, e.g., the proximity to the airfield and site preparation work (using imported fill) would likely increase the elevation of the site to that of the adjacent airfield.

The selected remedy for IRP Site 1 is NFA. The remedy is based on monitoring data that demonstrate decreasing concentrations over time, no specific threat to upper aquifer groundwater quality, the depth at which the contaminants are buried, the highly improbable chance for future exposure, and the most likely continued land use under the industrial/commercial reuse scenario. This remedy is protective of human health and the environment. Contaminant levels are below the MCL and diminishing, and the likelihood of any future exposure is extremely small. The remedy addresses ARARs because contaminant concentrations are below the MCL. The remedy is protective in the short term because no activity will be taken to access the residual contamination, thus allowing for exposure during handling and transport. The remedy is readily implementable and will be cost effective.

2.5.1.8 Expected Outcome of the Selected Remedy

The selected remedy will allow for unrestricted land use of IRP Site 1.

2.5.2 IRP Site 2 – Landfill No. 2

2.5.2.1 Site History

IRP Site 2 is located in the northeast corner of former Norton AFB and is the location of a former base landfill used between 1958 and 1980 (see Figure 1-2). Originally, it covered approximately

31 acres and was used for the disposal of general refuse, office waste, industrial waste, and IWTP sludge. Under CERCLA, the presumptive remedy for landfills is to leave waste in place and to provide an appropriate containment system (U.S. EPA, 1993a, 1993b). The rationale supporting this presumptive remedy reflects the cost and efforts required to excavate and transport landfill waste to a separate landfill, coupled with the CERCLA preference for on-site remedies and against moving wastes from one site to another. Under the presumptive remedy guidelines, various cover systems and associated gas control systems were evaluated in an EE/CA for IRP Site 2 (CDM, 1996e), and a natural soil cover was selected with an appropriate surface water control system (USAF, 1996c; IT Corporation, 1998). Because landfill gas (e.g., methane, PCE, TCE, and vinyl chloride) was present, a landfill gas control system was also required. The cover, surface water control, and gas control systems were described in an Action Memorandum (AM) (USAF, 1996c). The design (IT Corporation, 1998) for the landfill has been implemented with consolidation into a smaller footprint and construction of the landfill cover and gas collection/control systems completed in December 1998 and accepted by the BCT in February 1999.

2.5.2.2 Current and Potential Future Site Use

Site 2 is a closed landfill, and the property is currently zoned industrial/commercial by the city of San Bernardino. The projected long-term use of the site is expected to be passive open space.

2.5.2.3 Summary of Site Risk

The BWFS concluded that IRP Site 2 does not pose an unacceptable risk to human health or groundwater (CDM, 2003). However, the waste materials in the IRP Site 2 landfill were not completely characterized (although believed to be municipal waste).

2.5.2.4 Remedial Action Objectives

There are no human health COCs for IRP Site 2 based on the risk analysis. However, state landfill closure laws and regulations do establish maintenance requirements for IRP Site 2. Thus, the Air Force considers the following to be qualitative RAOs specific to IRP Site 2:

- Prevent contact with landfill waste and gases.

- Prevent or minimize migration of landfill contents to the vadose zone and to groundwater.
- Protect remedial system components and landfill cover from damage and protect the integrity of the cover and associated systems.
- Limit use of the property, by prohibiting use for residential purposes, hospitals for human care, public or private schools for persons less than 18 years of age, or day-care centers for children.

Because the waste materials in the IRP Site 2 landfill were not completely characterized (although believed to be municipal waste), the use restrictions will enhance the likelihood of achieving the RAOs and meeting California land use requirements related to landfills.

2.5.2.5 Analysis of Alternatives

The Air Force has completed the landfill cover, gas control, and surface water management systems at this site. These systems are part of the existing containment remedy for the landfill waste. The landfill is in the post-closure O&M phase, which will continue in accordance with the post-closure care plan.

Alternative 1 (NFA) would not meet the California ARARs for a closed landfill.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing for limitations on land use that run with the land. Alternative 2, coupled with the existing long-term O&M, would also provide assurance that ARARs would continue to be met in the future and that the residual risk is managed properly.

Alternative 2 provides for long-term control of the site by prohibiting activities that would adversely affect the integrity of the cover and control systems. The entire 31-acre site would be restricted to prevent disturbance to the landfill cover. ICs would, however, allow the Air Force access to the site for long-term O&M, monitoring, and inspections. Site fencing and signs warning against unauthorized personnel entry of the landfill area have already been installed. There are no short-term exposure concerns because all landfill construction actions have been completed, and the landfill gas treatment system has been constructed to address air quality-

related ARARs. Landfill closure ARARs require quarterly groundwater and soil gas monitoring until analytical results show no statistically significant releases from the landfill.

2.5.2.6 Description of the Selected Remedy

The selected remedy for IRP Site 2 is ICs as detailed in Section 2.3.4.2. This remedy adds ICs to the continuing operations, maintenance, and monitoring of the Site 2 landfill as specified in the existing, regulator-approved O&M Work Plan. The selected remedy is consistent with the anticipated future land use for Site 2 as a closed landfill. The ICs will be implemented to fulfill the following use limitations:

- Grantee covenants and agrees that it will not use IRP Site 2 for residential purposes, hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.
- Grantee covenants and agrees that it will not conduct or allow others to conduct any construction, excavation, drilling, grading, removal, trenching, filling earth movement, mining, planting that would disturb the soil or the landfill cover, including the vegetative cap, or the injection or release of water or other fluids except for the purpose of monitoring groundwater or landfill gas.
- Grantee covenants and agrees that it will not conduct or allow others to conduct any construction, excavation, drilling, grading, removal, trenching, filling earth movement, mining, planting that would result in contact with landfill waste materials.
- Grantee covenants and agrees that it will not conduct or allow others to conduct activities that would cause disturbance or removal of fencing or signs intended to exclude the public from the landfill.
- Grantee covenants and agrees that it will not conduct or allow others to conduct activities that would cause the surface application of water (e.g., irrigation) to the extent that the integrity of the landfill is impacted; nor the injection of water or other fluids that might affect groundwater flow direction.
- Grantee covenants and agrees that it will not conduct or allow others to conduct activities that would cause disturbance of any landfill equipment or systems, including the groundwater monitoring systems, and settlement monuments, or that could affect the drainage, sub-drainage, or erosion controls for the landfill cover.
- Grantee covenants and agrees that it will not conduct or allow others to conduct activities that limit access to any landfill equipment and systems, including the groundwater monitoring systems, settlement monuments, or the drainage, sub-drainage, or erosion controls for the landfill cover.

2.5.2.7 Summary of Rationale for the Selected Remedy

IRP Site 2 was closed through construction of a landfill cover and gas collection/treatment system. The current use of the site is that of a closed landfill; the projected long-term use of the site is expected to be passive open space. The selected remedy for the closed landfill is ICs that restrict land-use activities that could adversely affect the cover, including any type of earthwork (excluding O&M), and preclude the drilling of wells into or through the cover except those necessary for site O&M.

The selected remedy of ICs and continuing O&M of the containment system is protective of human health and the environment. Residual contaminants are contained and treated, and O&M procedures minimize worker exposure to site contaminants (landfill gas). ICs, coupled with long-term O&M, provide assurance that ARARs are met now and in the future and that the residual risk is managed properly. The remedy is protective in the short term because all landfill construction actions have been completed, and the landfill gas treatment system has been constructed to address air quality-related ARARs. Landfill closure ARARs require groundwater and soil gas monitoring until analytical results show no statistically significant releases from the landfill. The remedy is protective in the long term by prohibiting activities at the site that would adversely affect the integrity of the cover and control systems. Existing engineering controls to complement the ICs include site fencing to prevent unauthorized access. The entire 31-acre site is restricted to prevent disturbance of the landfill. The ICs allow the Air Force access to the site for long-term O&M, monitoring, and inspections. Site fencing and signs warning unauthorized personnel to stay outside of the landfill area have been installed. The landfill gas collection and destruction system reduces VOC concentrations in soil gas thus addressing the reduction of TMV of contaminants. The landfill closure remedy has already been implemented and is cost effective.

2.5.2.8 Expected Outcome of the Selected Remedy

Implementation of the selected remedy at IRP Site 2 will allow for current and most likely future reuse plans for the site.

2.5.3 IRP Site 5 – Fire Protection Training Area No. 2

2.5.3.1 Site History

IRP Site 5 served as the training area for fire control and abatement exercises from the late 1950s through the 1970s. Site 5 is in the southern portion of the former base, east of the golf course (see Figure 1-2). Fire training exercises involved floating a layer of oil, fuel, or other combustible material on a layer of water and repeatedly igniting and extinguishing the material. RI results showed the site to contain metals (cadmium, copper, lead, and zinc) and dioxins in near-surface soils (to 10 feet bgs) and fuels (benzene, toluene, ethylbenzene, xylenes [BTEX]), solvents, and PAHs in deeper soils up to 40 feet bgs (CDM, 1993b, 1994b; Earth Tech, 1993).

The EE/CA (Earth Tech, 1995) and subsequent AM for IRP Site 5 (USAF, 1997b) selected soil vapor extraction (SVE) for remediation of fuel contamination, excavation followed by stabilization of the metals/dioxin-contaminated soil, and excavation and disposal of the PAH-contaminated soil. This removal action was completed during 1998 and involved an area of approximately 100,000 square feet. Excavation was performed to a maximum depth of 13 feet bgs, and confirmation samples were taken on the sidewalls and bottom of the excavation. The SAR impact berm adjacent to IRP Site 5 was also removed during the Site 5 removal action.

The SVE component of the remedy removed 22,600 pounds of hydrocarbons. The SVE system was operated from January 10, 1996, until July 10, 1997. The effectiveness of the SVE system was assessed through confirmation soil boring samples and vadose zone leaching modeling. The model simulations indicated that the SVE removal adequately addressed the hydrocarbon contamination and was protective of groundwater.

The soil excavation was performed in two phases. The first phase consisted of the removal of 21,104 tons of contaminated soil and 4,589 tons of rock and debris. This material was transported to the IRP Site 2 landfill. The lead in the contaminated soil was stabilized using 15 percent (by weight) Portland cement to meet State of California nonhazardous waste criteria. The soil that met nonhazardous criteria was used as foundation material for the landfill cap. The material not meeting the California nonhazardous waste criteria (1,443 tons) met federal nonhazardous waste criteria and was shipped to Browning Ferris Industries (BFI) landfill in La

Paz, Arizona, for disposal. The second phase involved excavation of 3,496 tons of contaminated soil, stabilized with 15 percent (by weight) Portland cement, which was shipped to the BFI landfill in Arizona for disposal as an RCRA nonhazardous waste. The excavation area was backfilled with clean soil to the level of the former topographic grade.

Confirmation sampling indicated the presence of cadmium and lead (from 3 feet bgs to at least 10 feet bgs) and dioxins (from 3 feet bgs to at least 10 feet bgs) in excess of residential PRGs. Additionally, arsenic was detected in excess of the background concentration. The area of impacted soil is approximately 150 feet by 350 feet. Figure 2-5 shows the locations where cadmium, lead, and dioxins (TCDD) exceed their residential PRGs, and where arsenic exceeds background at IRP Site 5. No groundwater contamination is associated with IRP Site 5 (CDM, 2000b).

2.5.3.2 Current and Potential Future Site Use

The site is being used for storage of golf course landscape waste prior to off-site disposal, and the property is currently zoned industrial/commercial by the city of San Bernardino. The projected long-term use of the site is expected to be industrial/commercial-related.

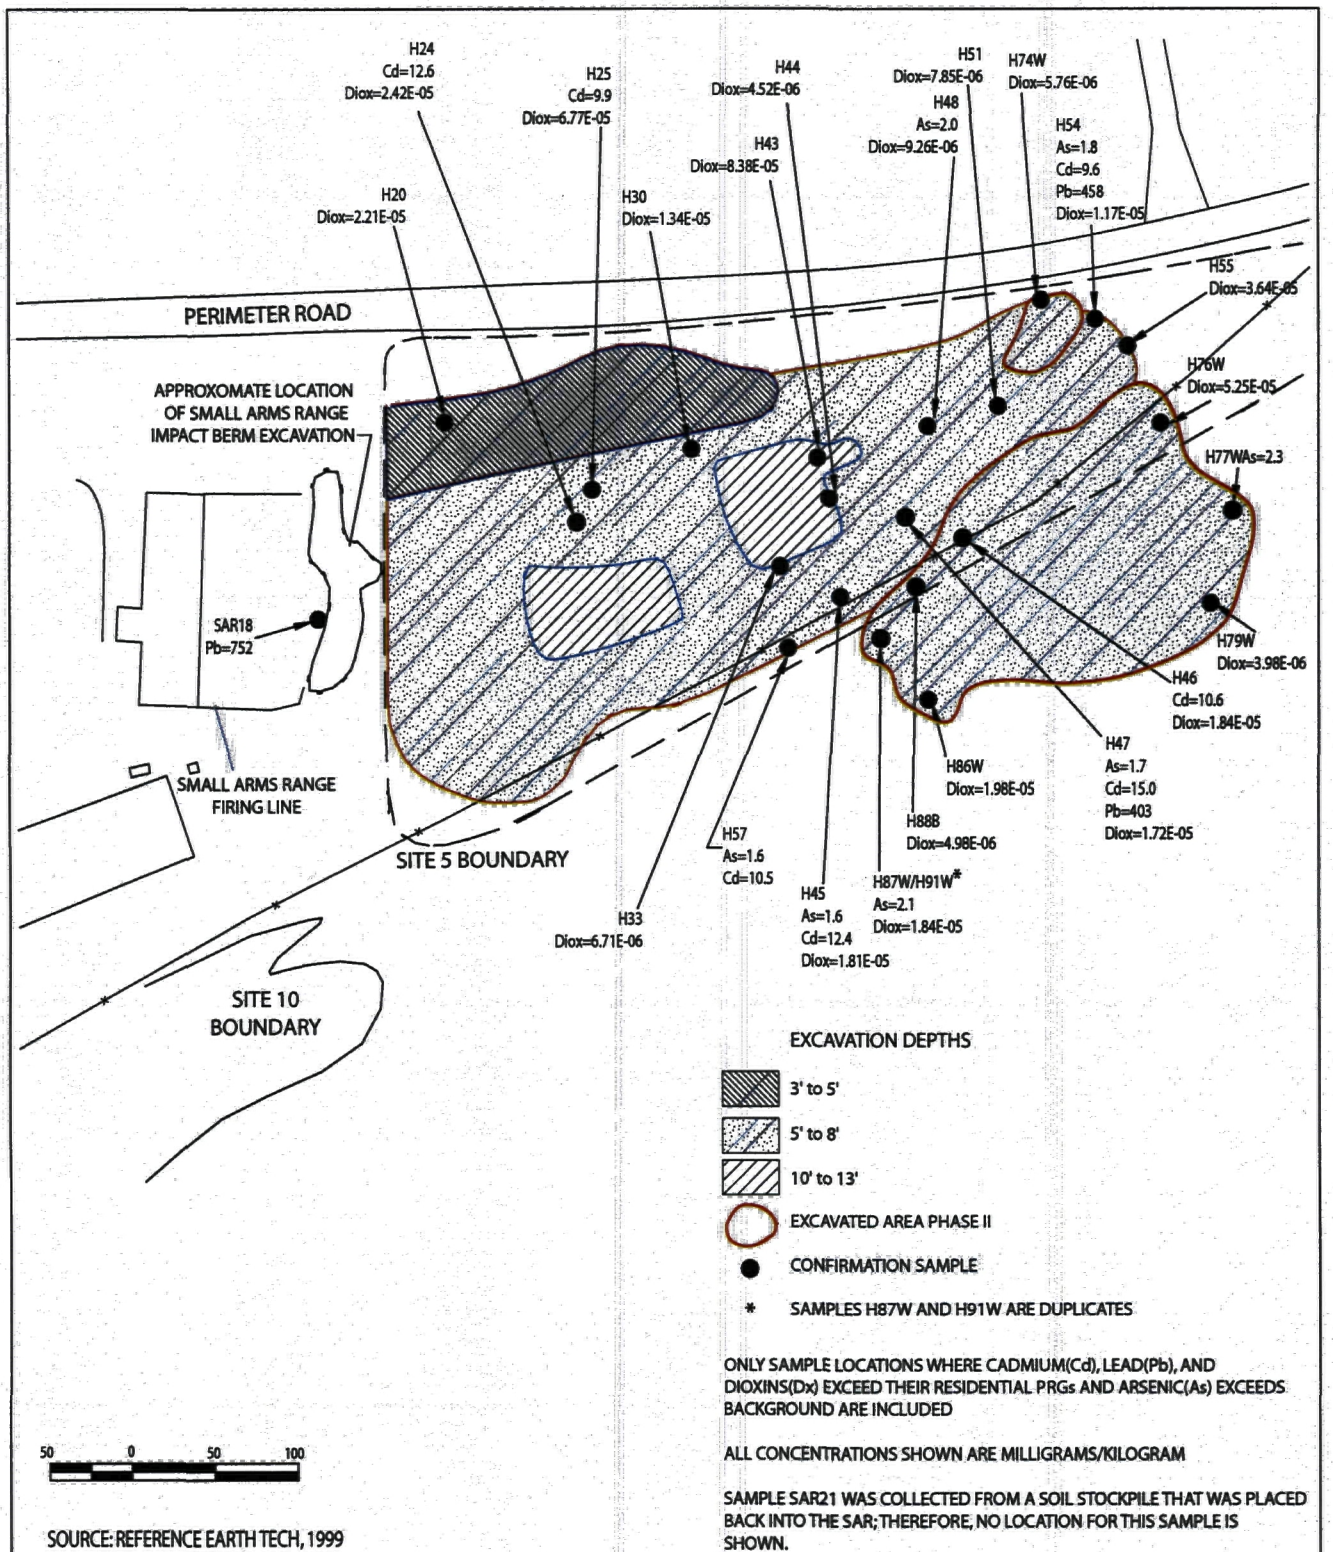
2.5.3.3 Summary of Site Risk

The BWFS concluded that IRP Site 5 does not pose unacceptable cancer risk or non-cancer HI; however, the modeled child blood-lead level was unacceptable for unrestricted land use. Table 2-11 summarizes the BWFS risk analysis results.

2.5.3.4 Remedial Action Objectives

The RAO for IRP Site 5 is:

Limit use of property to prevent exposure to lead-contaminated soil under an unrestricted land use scenario.



ONLY SAMPLE LOCATIONS WHERE CADMIUM(Cd), LEAD(Pb), AND DIOXINS(Dx) EXCEED THEIR RESIDENTIAL PRGs AND ARSENIC(As) EXCEEDS BACKGROUND ARE INCLUDED

ALL CONCENTRATIONS SHOWN ARE MILLIGRAMS/KILOGRAM

SAMPLE SAR21 WAS COLLECTED FROM A SOIL STOCKPILE THAT WAS PLACED BACK INTO THE SAR; THEREFORE, NO LOCATION FOR THIS SAMPLE IS SHOWN.

Table 2-11

Summary of Site 5 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	3 to 10	1.2	8.9×10^{-7}	0.011	5.4	Arsenic, lead, dioxins	Acceptable risk under industrial reuse scenario
Unrestricted	3 to 10	1.2	1.0×10^{-5}	0.5	12.6	Arsenic, lead, dioxins	Cancer risk is within risk management range; non-cancer HI risk is acceptable; child blood-lead level exceeds 10 µg/dL target.

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

2.5.3.5 Analysis of Alternatives

The Air Force removed contamination from the fire protection training area, using both SVE and soil excavation. The SVE system removed soluble contaminants to concentrations protective of groundwater. The near-surface contamination was removed along with a significant portion of the subsurface contamination. The industrial cancer risk at this site is 8.9×10^{-7}, the HI is 0.011, and the adult blood-lead level is 5.4 micrograms per deciliter (µg/dL), all indicating minimal risk. The unrestricted cancer risk, assuming excavation to 5 feet bgs and bringing the contaminants to the surface, is 1.0×10^{-5} (within the risk management range of 1×10^{-4} to 1×10^{-6}), the child HI is 0.5, and the child blood-lead level is 12.6 µg/dL (exceeding the 10 µg/dL target). Groundwater monitoring data collected since the mid-1980s have shown no groundwater impact, even prior to the soil removal and SVE actions; therefore, no future adverse environmental impacts are predicted to groundwater.

Alternative 1 (NFA) is not potentially protective of human health and the environment under the unrestricted land-use scenario. The land is zoned for industrial/commercial uses, and the proposed base master plan identifies the site area for industrial buildings. The current and likely

near-future use of the site is that of a support area for the adjacent Palm Meadows Golf Course. Projected long-term reuse is for industrial/commercial-related projects. NFA would fail to provide adequate assurance of long-term effectiveness and permanence under an unrestricted land use scenario.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing for limitations on land use that "run with the land." The ICs would prohibit residential reuse of the site, notify others about the presence of the soils contamination, and allow for access to inspect ongoing land-use activities. The ICs would address the entire 1.2-acre site. There are no short-term concerns with this alternative.

Alternative 3 (Containment) does not apply to this site, other than the existing 5 feet of soil used to backfill the site excavation following the soil removal action.

2.5.3.6 Description of the Selected Remedy

The selected remedy for IRP Site 5 is ICs as detailed in Section 2.3.4.2. The ICs will be implemented to fulfill the following use limitations:

- Grantee covenants and agrees that it will not use IRP Site 5 for residential purposes, hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.
- Grantee covenants and agrees that it will not conduct or allow others to conduct activities that limit access to the site for inspections.

2.5.3.7 Summary of Rationale for the Selected Remedy

Residual soil contamination at IRP Site 5 (primarily lead and dioxins) remains buried beneath 3 to 5 feet of backfill soil, minimizing any direct contact threat. Located immediately beneath the upper soil cover is soil that was pushed into the Site 5 excavation from the adjacent SAR impact berm. The soil from the impact berm is assumed to contain lead, potentially at concentrations greater than the residual lead at Site 5. The combined unrestricted child/adult residual excess cancer risk for Site 5 is 1×10^{-5}, which is within the acceptable risk management range (1×10^{-4} to 1×10^{-6}), and the child blood-lead level is 12.6 µg/dL, exceeding the 10 µg/dL target. The blood-lead level does not include lead that may be in the SAR impact berm soil at Site 5. The site is currently being used for storage of golf course landscape waste prior to off-site

disposal. The projected long-term reuse plans are as an extension of the adjacent Palm Meadows Golf Course or industrial/commercial-related uses for the area south of the airfield runway, which is consistent with city of San Bernardino zoning. Reuse of the site for residential purposes is not possible due to its proximity to the airfield and FAA restrictions.

This selected remedy is based on the current and most likely reuse of the site. The risk to industrial workers is acceptable, and it is unlikely that the site can be redeveloped for anything other than open space and/or commercial/industrial purposes due to the proximity of the runway, and the site location adjacent to the Santa Ana River floodplain. The remedy is protective of human health and the environment based on the most likely exposure scenario. The remedy addresses ARARs because contaminant concentrations are within the risk management range. The remedy is protective in the short term because no additional activity will be taken to access any residual contamination. The remedy is protective in the long term because any development will be controlled through the use of ICs; no residential (unrestricted) use will be allowed. The remedy is readily implementable and will be cost effective.

2.5.3.8 Expected Outcome of the Selected Remedy

Implementation of the selected remedy at IRP Site 5 will allow for current and most likely future reuse plans for the site. Unrestricted reuse will be prohibited in accordance with the ICs and deed restrictions.

2.5.4 Small Arms Range

2.5.4.1 Site History

The SAR was located immediately adjacent to IRP Site 5 and historically included an impact berm. The berm was contaminated by lead projectiles as a result of small arms practice, and a removal action was addressed in a work plan (Earth Tech, 1997b). Because the berm was contiguous with Site 5, portions of the berm were removed during the Site 5 removal action. A total of 11,478 tons of material was removed from the SAR, including 210 tons of bullet fragments and rock, classified as RCRA hazardous waste, and disposed at the Laidlaw Environmental Services landfill in Westmoreland, California. Nonhazardous waste, including 128 tons of rock and debris and 9,124 tons of soil, was placed at the IRP Site 2 landfill. The

remaining 2,106 tons of soil were stabilized with 15 percent (by weight) Portland cement. This material did not meet California nonhazardous waste criteria and was shipped to the BFI landfill in Arizona for disposal. Confirmation samples were collected, and lead was detected above the residential PRG at one location.

Following completion of the soil removal action, much of the remaining portion of the SAR impact berm was pushed into the Site 5 excavation as fill. The soil from the berm was then covered with soil imported from the adjacent riverbed to bring the Site 5 area back to its original grade. The firing line area of the SAR remains as a ground depression and is not being used. Projected long-term plans for the area are industrial/commercial-related use.

2.5.4.2 Current and Potential Future Site Use

The firing line area remains as a ground depression and is not being used. Projected long-term use of the site is expected to be commercial/industrial-related options for the property.

2.5.4.3 Summary of Site Risk

The BWFS concluded that the modeled child blood-level and non-cancer risk are unacceptable for residential (unrestricted) reuse of the site. Table 2-12 summarizes the BWFS risk analysis results.

2.5.4.4 Remedial Action Objectives

RAOs for the SAR are:

- Limit use of property to prevent exposure to lead-contaminated soil under an unrestricted land use scenario.
- Limit use of property to prevent exposure to non-cancer risk contaminated soil under an unrestricted land use scenario.

2.5.4.5 Analysis of Alternatives

The SAR was subjected to a removal action that involved collection and disposal of lead projectile debris and the use of the projectile impact berm as sub-base fill for the adjacent Site 5

Table 2-12

Summary of SAR Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	Surface	0.1	9.3×10^{-7}	0.046	10.7	Arsenic, lead, dioxins	Acceptable cancer and non-cancer risk under industrial reuse scenario; adult blood-lead level (unrestricted exposure) marginally exceeds the 10 µg/dL target.
Unrestricted	Surface	0.1	1.1×10^{-5}	2.2	32.9	Arsenic, cadmium, lead	Cancer risk is within risk management range; adult non-cancer HI risk is acceptable (0.064); child non-cancer HI risk >1; child blood-lead level exceeds 10 µg/dL target.

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

excavation. The portion of the berm pushed into the Site 5 excavation is buried beneath approximately 5 feet of backfill soil. Some surface soil contamination remains in areas of the SAR not addressed by the removal action. The industrial-reuse cancer risk at this site is 9.3×10^{-7}, the HI is 0.046, and the adult blood-lead level is 10.7 µg/dL. The blood-lead level (10.7 µg/dL) exceeds the adult limit of 10.0 µg/dL. The unrestricted cancer risk is 1.1×10^{-5} (within the risk management range of 1×10^{-4} to 1×10^{-6}), the child HI is 2.2, and the modeled child blood-lead level is 32.9 µg/dL (exceeding the 10 µg/dL target). Lead, therefore, poses the primary risk at this site.

Alternative 1 (NFA) is potentially not protective of human health and the environment under an unrestricted land use scenario. The site includes elevated concentrations of lead (a persistent metal) in surface soils, which poses a direct contact risk to children. The site is currently not being used. The most likely near-future reuse of the site is as an extension of the adjacent Palm Meadows Golf Course. Projected long-term reuse plans are for industrial/commercial-related uses. It is very unlikely that the property would be developed for residential type of use because

it is zoned by the city of San Bernardino as industrial/commercial, and the proposed master plan for the base identifies the site area for industrial buildings. In addition, the site is adjacent to the active runway.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing for limitations on land use that "run with the land." ICs would prohibit unrestricted (residential) reuse of the site, notify others about the presence of the soil contamination, and allow access to inspect ongoing land-use activities. The ICs would address the entire 0.1-acre site and identify surface soil contamination. There are no short-term concerns with this alternative.

Alternative 3 (Containment) is one possible option for this site. The firing area of the former SAR remains as a ground depression below the grade of the adjacent land area. A 5-foot layer of backfill soil could be used as the final cover material over the contaminated soil. Placement and covering of soil within the firing line area could be performed to address soil-handling, placement, and containment (cover) ARARs. The containment alternative could be completed in about 3 months. The containment cover would marginally improve short-term protectiveness by reducing the opportunity for dermal contact and ingestion of contaminated soil. However, long-term protectiveness would require the addition of, and reliance on, the ICs as specified in Alternative 2. There is considerable additional cost for containment without applicable benefit to human health or the environment.

Alternative 4 (Removal), would provide some additional long-term effectiveness and permanence by removing the contamination from the site, but not without significant additional costs. This alternative could be implemented to meet ARARs for excavation, transport, waste classification, and disposal of contaminated soil. The potential for short-term exposure of workers and the community would need to be controlled for any removal action. The removal alternative could be accomplished in less than 3 months and would result in long-term protection for the site allowing for unrestricted reuse. Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV.

2.5.4.6 Description of the Selected Remedy

The selected remedy for the SAR is ICs as detailed in Section 2.3.4.2. The ICs will be implemented to fulfill the following use limitations:

- Grantee covenants and agrees that it will not use the SAR for residential purposes, hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.
- Grantee covenants and agrees that it will not conduct or allow others to conduct activities that limit access to the site for inspections.

2.5.4.7 Summary of Rationale for the Selected Remedy

Residual contamination at the SAR consists of lead in surface soils at concentrations that would potentially pose a risk to children under an unrestricted land use scenario. The combined unrestricted adult/child surface soil cancer risk is 1.1×10^{-5}, which is within the acceptable risk management range of 1×10^{-4} to 1×10^{-6}, and the modeled child blood-lead level is 32.9 µg/dL, exceeding the 10 µg/dL target. The site is not being used. The projected long-term plans for reuse are as an extension of the adjacent Palm Meadows Golf Course or industrial/commercial-related uses. The site is adjacent to the Santa Ana River floodplain and the airport runway. Reuse of the site for residential (unrestricted) purposes is not likely. The concern for the site is excavation and proper reuse of the lead-contaminated soil. The selected remedy for the SAR is to establish ICs precluding unrestricted land use.

The selected remedy is protective of human health and the environment. The risk to industrial workers is acceptable, and the probable reuse of the site is for industrial/commercial building structures. The ICs will ensure long-term protectiveness, and no unrestricted usage will be allowed. The selected remedy does not involve treatment, but residual contaminant concentrations do not require treatment under State and Federal waste management regulations. The remedy meets ARARs because contaminant concentrations are within the risk management range, and no soil handling and disposal will be required. The remedy is protective in the short term because no activity will be taken to access or move the residual contamination. The remedy is readily implementable and will be cost effective.

2.5.4.8 Expected Outcome of the Selected Remedy

Implementation of the selected remedy at the SAR will allow for current and most likely future reuse plans for the site. Unrestricted (residential) land use will be prohibited in accordance with the ICs and deed restrictions.

2.5.5 IRP Site 7 – IWTP Sludge Drying Beds

2.5.5.1 Site History

IRP Site 7 is located in the southeast corner of the former IWTP compound (see Figure 1-2). Although Site 7 is part of this CERCLA ROD, as part of the former IWTP, Site 7 also must be closed as part of the RCRA corrective action termination of the interim status facility (two separate closure processes). The site included 12 concrete-walled, unlined sludge-drying beds, covering approximately 17,280 square feet. The beds were used to dry sludge generated at the IWTP until 1987. During removal of the sludge, it was temporarily stored at the northeast corner of the site.

Sampling during the IRP and 1991 RI indicated some metal concentrations above background concentrations in near-surface samples (CDM, 1993b).

In 1999, DTSC, as part of the RCRA closure evaluation for the IWTP facility, requested sampling of the concrete walls and soils within the waste pile area. Sampling was performed during January 2000. The concrete was analyzed for metals, radionuclides, chlorinated pesticides, PCBs, and PAHs. Low concentrations of pesticides, PCBs, and PAHs were reported, and metals and radionuclides reflected background ranges (CDM, 2000c). The soil samples exhibited low concentrations of metals, pesticides, PCBs, and PAHs in the surface interval only. The former waste pile appears to have been located on what is now highly weathered asphalt pavement. Based on the soil sampling results, DTSC requested additional sampling of the waste pile area for PAHs. Eight surface soil samples were collected in June 2000 (CDM, 2001). Cadmium, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, and dibenzo(a,h) anthracene exceeded residential PRGs as shown on Figure 2-6.

LOCATIONS WHERE PAHs AND CADMIUM EXCEED PRG AND ARSENIC EXCEEDS BACKGROUND IRP SITE 7 AREA FORMER NORTON AIR FORCE BASE

Figure 2-6

Physical removal and disposal of the concrete-walled sludge-drying beds and surface soils were completed in March 2004, and the CERCLA closure report is in review.

2.5.5.2 Current and Potential Future Site Use

The site is currently not being used. The property is zoned industrial/commercial by the city of San Bernardino. Projected long-term use of the site is expected to be commercial/industrial-related options for the property.

2.5.5.3 Summary of Site Risk

The BWFS concluded that, although excess cancer risk is within the acceptable risk range, the child non-cancer HI was unacceptable, due primarily to PAHs in surface soil. The unrestricted land use exposure risk scenario was calculated at the highest end of the acceptable range.

Table 2-13 summarizes the BWFS risk analysis results. The physical removal action in March 2004 further reduced the level of PAHs and residual cancer risk.

Table 2-13

Summary of Site 7 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	0 to 20	0.5	1.2×10^{-5}	0.03	3.5	Arsenic, PAH	Acceptable risk under industrial reuse scenario
Unrestricted	0 to 20	0.5	1.0×10^{-4}	1.4	5.3	Arsenic, PAH	Cancer risk is within risk management range; adult non-cancer HI risk is acceptable (0.041); child non-cancer HI risk >1; blood-lead level less than 10 µg/dL target.

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

bgs = below ground surface
HI = Hazard Index
PAH = polynuclear aromatic hydrocarbon
µg/dL = micrograms per deciliter

2.5.5.4 Remedial Action Objectives

As stated in Section 2.5.5.1, Site History, Site 7 is part of an RCRA interim status facility. The RAOs for IRP Site 7 are intended to integrate both the CERCLA response and RCRA corrective action obligations, which are two separate processes (Norton FFA, Section 17):

- Remove concrete drying beds (RCRA obligation).
- Reduce the non-cancer risk to an individual to an HI less than 1 ("the NCP non-cancer risk remedial goal") (CERCLA/RCRA obligations).

Physical removal and disposal of the concrete-walled sludge-drying beds and surface soils were completed in March 2004, and the CERCLA closure report is in review.

2.5.5.5 Analysis of Alternatives

IRP Site 7 exhibits surface soil contamination by PAHs (possibly the result of a highly weathered asphalt roadway), PCBs, and metals. The contaminants are typically insoluble and relatively persistent. The industrial-reuse cancer risk at this site is 1.2×10^{-5}, the HI is 0.03, and the adult blood-lead level is 3.5 µg/dL. The unrestricted cancer risk is 1×10^{-4} (the high end of the risk management range of 1×10^{-4} to 1×10^{-6}), the child HI is 1.4, and the modeled child blood-lead level is 5.3 µg/dL. The site, therefore, poses a potential direct contact risk, primarily under the unrestricted land use scenario. The site is adjacent to the golf course. Long-term reuse plans for the site are as an extension of the golf course or for industrial/commercial-related uses.

Alternative 1 (NFA) does not address management of residuals and may not be protective of human health for unrestricted land use. It is unlikely that the property would be developed for unrestricted use because it is zoned industrial/commercial, and the proposed master plan for the base identifies the site area being used for industrial/commercial buildings. NFA does not address the RCRA requirement to remove facilities and equipment once operations are terminated.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing for limitations on land use that "run with the land." ICs would prohibit unrestricted

reuse of the site, notify others about the presence of the soils contamination, and allow access to inspect ongoing land-use activities. The ICs would address the entire 0.5-acre site and identify surface soil contamination. There are no short-term concerns with this alternative. ICs do not address the RCRA requirement to remove facilities and equipment once operations are terminated.

Alternative 3 (Containment) is a consideration for providing additional protection should the golf course be extended over the site or be paved for industrial use. Containment would consist of a nominal 2-foot layer of soil over which the golf course sod could be grown under one reuse scenario. Containment could be accomplished in a matter of weeks and would be highly protective in the short term because minimal contact with waste would occur. Containment would need to be accompanied by the ICs alternative for long-term protectiveness, and would be only marginally more protective than ICs alone. Containment does not address the RCRA requirement to remove facilities and equipment once operations are terminated.

Alternative 4 (Removal) would provide for long-term effectiveness and permanence by removing the contamination from the site. Because the site contamination is limited, the action could be easily implemented, and would likely result in site conditions allowing for unrestricted land use. Future Air Force cost savings (IC monitoring and reporting) would result from cleanup to unrestricted land use levels. Removal actions do pose short-term exposure concerns because of the material handling required. Any additional soil removal could be accomplished to address soil excavation, transport, and disposal of ARARs. Soil removal could be accomplished in a matter of weeks, but would have slightly greater short-term risk concerns due to soil handling and transport. Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV. The concrete walls that form the Site 7 sludge beds are not a source of the contamination; however, the walls need to be removed as part of the RCRA closure of the former IWTP facility. Removal of the walls would also facilitate reuse of the site location by the IVDA.

Physical removal and disposal of the concrete-walled sludge-drying beds and surface soils were completed in March 2004, and the CERCLA closure report is in review.

2.5.5.6 Description of the Selected Remedy

As part of the IWTP RCRA corrective action termination of the interim status facility, concrete structures of the drying beds were removed and disposed off base at an RCRA-permitted facility and for selective removal of surface soil contaminated with PAHs. The Air Force does not intend to remove the abandoned asphalt road or the PAHs associated with its decay. At the time of the selective surface removal, the remaining contaminant levels will be characterized to ensure that all contaminated soil related to the use of the site area for IWTP sludge drying and management have been removed to within the acceptable risk management range of 1×10^{-4} to 1×10^{-6} with an HI less than 1.0. Physical removal and disposal of the concrete-walled sludge-drying beds and surface soils were completed in March 2004, and the CERCLA closure report is in review.

2.5.5.7 Summary of Rationale for the Selected Remedy

IRP Site 7 exhibits surface soil contaminated by PAHs and the remains of concrete walls that formed the IWTP sludge-drying beds. The site is within the compound that includes the former site of the IWTP facility. The combined unrestricted adult/child residual excess cancer risk is 1×10^{-4} (at the high end of the acceptable risk management range of 1×10^{-4} to 1×10^{-6}), and the child non-cancer HI is 1.4. The selected remedy for Site 7 is removal of the concrete structures of the drying beds for disposal off base at an RCRA-permitted facility and for selective removal of surface soil contaminated with PAHs. Projected long-term reuse plans for the site are industrial/commercial-related development, which is consistent with city of San Bernardino zoning.

The remedy is protective of human health and the environment through removal of surface contamination that poses a potential risk under an unrestricted land use scenario. The remedy will address ARARs involving concrete, soil, and waste excavation, transport, and disposal, as well as for worker and community protection. The remedy is protective in the short term through implementation of measures to prevent release of contaminants during waste handling and transport. The remedy is protective in the long term due to the reduction in contamination at the site. Soil contaminant concentrations are not sufficient to warrant treatment prior to disposal. The remedy is readily implementable and cost effective.

Physical removal and disposal of the concrete-walled sludge-drying beds and surface soils were completed in March 2004, and the CERCLA closure report is in review.

2.5.5.8 Expected Outcome of the Selected Remedy

Implementation of the selected remedy at IRP Site 7 will allow for unrestricted reuse of the site. Physical removal and disposal of the concrete-walled sludge-drying beds and surface soils were completed in March 2004 and the CERCLA closure report is in review.

2.5.6 IRP Site 10 – Landfill No. 1

2.5.6.1 Site History

Site 10 is located along the southern base boundary in the eastern portion of the golf course (see Figure 1-2). Landfill No. 1 was used by the Air Force from 1943 to 1958, primarily for disposal of general refuse, which was apparently burned at the site. The 1984 to 1995 investigations, which included sampling for metals, pesticides, PAHs, and PCBs, indicated the presence of metals in ash (primarily chromium and lead) above the residential soil PRGs in shallow soil (0 to 2 feet bgs).

Based on the RI data for metals, an RA for Site 10 was evaluated in an EE/CA (CDM, 1996f). Because contamination was not significantly above industrial soil cleanup goals, the Air Force elected to establish a deed restriction for the site (USAF, 1997d). However, the ERA (CDM, 1998a) determined that the contamination was localized, and concentrations of chromium and lead at the hot spots posed a significant risk to plants and animals. The Air Force responded by developing a hot-spot removal plan for Site 10 (Bechtel Environmental, 1997b). A removal action was performed at four hot spot locations that resulted in excavation of 340 cubic yards of contaminated soil. Approximately 224 cubic yards of contaminated soil were disposed at the Site 2 landfill, and 116 cubic yards were disposed off site (Bechtel Environmental, 1998).

Confirmation samples were collected upon completion of the removal action, and cadmium and lead exceeded their respective residential soil PRGs. No groundwater contamination is associated with Site 10 (CDM, 2000b).

DTSC requested (in their comments on the draft final version of the BWFS dated June 2, 1999) further characterization of PAHs and dioxins. In January 2000, the Air Force collected additional soil samples for PAHs and dioxins. The data are reported in a Technical Memorandum dated February 21, 2000 (CDM, 2000d).

PAHs were not detected above residential PRGs. Dioxins were detected within and adjacent to the ash material at concentrations in excess of the residential PRGs. Further characterization of dioxins was performed in September 2000 (CDM, 2000e). Dioxins were detected primarily along the base boundary among surface rubble, but also within habitat for two endangered species, the San Bernardino kangaroo rat and the Santa Ana River woolly star.

Physical removal and disposal of dioxin-contaminated soil were completed in 2004, and the closure report is in preparation.

2.5.6.2 Current and Potential Future Site Use

The northern portion of the site is used as a golf course fairway, and the property is currently zoned industrial/commercial by the city of San Bernardino. Projected long-term use of the site north of the base boundary is expected to be industrial-related. The southern portion of the site includes habitat for two endangered species, and is bounded by a man-made flood protection levee. The southern portion is off base and is zoned open space with unrestricted public access.

2.5.6.3 Summary of Site Risk

The BWFS concluded that, even though the unrestricted cancer risk was within the risk management range, residual risk to human health posed by dioxins would not allow for unrestricted reuse. Several factors went into this determination, including maximum dioxin concentrations of over an order of magnitude greater then the exposure point concentration used in the risk assessment calculation and its persistent, bio-accumulative nature. In addition, the dioxin concentration posed potential adverse risk to ecological receptors. Table 2-14 summarizes the BWFS risk analysis results. The physical removal action completed in 2004 reduced the level of dioxins and residual cancer risk; the closure report is in regulatory review.

Table 2-14

Summary of Site 10 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	0 to 4	6	1.4×10^{-6}	0.019	4.6	dioxins, metals, lead	Acceptable risk under industrial reuse scenario
Unrestricted	0 to 4	6	1.9×10^{-5}	0.86	9.4	dioxins, metals, lead	Cancer risk is within risk management range; non-cancer HI risk is acceptable; blood-lead level less than 10 µg/dL target.

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

2.5.6.4 Remedial Action Objectives

RAOs for IRP Site 10 are:

- Reduce the ecological hazard quotient to less than 1.
- Reduce the lifetime excess cancer risk to an individual of between 1×10^{-4} and 1×10^{-6} using 1×10^{-6}.

Physical removal and disposal of dioxin-contaminated soil were completed in 2004, and the closure report is in regulatory review.

2.5.6.5 Analysis of Alternatives

Landfill No. 1 was subjected to a removal action for metals contamination based on the recommendations made in the 1998 ERA (CDM, 1998a). Dioxin contamination was discovered after the removal action was completed, prompting the evaluation of additional actions. The results of the HHRA demonstrated that cancer risk from residual contamination is 1.4×10^{-6}, HI is 0.019, and adult blood-lead level is 4.6 µg/dL, the lower end of the risk management range for industrial reuse. The cancer risk from residual contamination for unrestricted land use is 1.9×10^{-5} (within the risk management range of 1×10^{-4} to 1×10^{-6}), child HI is 0.86, and child blood-

lead level is 9.4 µg/dL. Additionally, the highest dioxin levels are not located on former base property and include endangered species habitat. Residual dioxin contamination is in surface and near-surface soil (typically 0 to 2 feet bgs), with the highest concentrations associated with ash material found along the base boundary.

A portion of Site 10 includes habitat for two endangered species. Dioxin concentrations within the habitat are significantly less than the concentrations within the soil ash. The concern for the site includes prevention of human exposure to residual contamination under an unrestricted land-use scenario and protection of the endangered species and their habitat. A portion of the dioxin contamination is beneath the golf course, land owned by the Air Force and leased to the IVDA. The off-base contamination is on land owned by the city of Riverside. Alternative evaluation must consider land-use options of both landowners.

Alternative 1 (NFA) does not address the management of residual contamination and may not be protective of human health for unrestricted land use. The ERA determined that the NFA alternative would not be protective of ecological receptors. Unrestricted land use is highly unlikely since the site is partially within the Santa Ana River floodplain and designated as endangered species habitat. However, there are no restrictions to public access to the site and its vicinity.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing for limitations on land use that "run with the land." As with the NFA alternative, ICs would not be protective of ecological receptors. ICs would prohibit unrestricted land use of the site, notify others about the presence of the soils contamination, and allow access to inspect ongoing land-use activities. The ICs would address the entire site area that exhibits dioxin contamination above the residential PRG (5 to 10 acres) and identify surface soil contamination. There are no short-term concerns with this alternative.

Alternative 3 (Containment) is considered for providing additional protection for contamination beneath the golf course portion of Site 10 and to provide ecological and human health protection for the off-site portion of Site 10. Containment by capping the area using 2 feet of backfill soil would require rebuilding portions of the golf course fairways. Implementation would require

consultation with the USFWS. In addition, the containment alternative would likely need to include ICs prohibiting unrestricted land use.

Alternative 4 (Removal) would provide long-term effectiveness and permanence by removing dioxin contamination from the site, but not without significant additional cost. Although contamination above ambient levels affects approximately 15 acres, the area of highest concentrations only encompasses 5 to 10 acres. Soil contamination is shallow, and a removal action may only involve depths of approximately 2 feet bgs. Removal of the highest concentrations of dioxins (greater than 10 nanograms per kilogram [ng/kg]) would reduce the average soil concentration for dioxin contamination to the 10^{-6} unrestricted risk range point of departure for determining remediation goals. The ERA concluded that a 10 ng/kg level would also be protective of ecological receptors. Backfilling with clean soil would further reduce the opportunities for exposure to any residual contamination. Implementation would require consultation with the USFWS regarding endangered species habitat. For removal based on 10 ng/kg, long-term controls in the form of ICs would not be necessary. Removal poses short-term exposure concerns because of the material handling required. Soil removal could be accomplished to address excavation, transport, and disposal ARARs that would be protective of human health and the environment during implementation. Soil removal could be accomplished in about 1 month. Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV.

Soil excavated from Site 10 could be disposed in one of three manners. The excavated soil could be transported off site for disposal at a regulated facility. Off-site disposal would have short-term risks due to soil handling and transport and long-term concerns with the receiving facility. Excavated soil could be transported for disposal at a new cell constructed at the Site 2 landfill. This option would have fewer short-term concerns, with long-term concerns the same as for Site 2. Construction of a new cell could reduce the amount of developable land in the NBA. Excavated soil could be disposed in the SAR depression. This option would have the least short-term handling concerns, with long-term concerns addressed through the Norton AFB ICs oversight and enforcement process. The regulatory agencies and IVDA have indicated a preference for off-site disposal of the wastes.

Physical removal and disposal of dioxin-contaminated soil were completed in 2004, and the closure report is in regulatory review.

2.5.6.6 Description of the Selected Remedy

The selected remedy for IRP Site 10 is excavation and disposal of dioxins in excess of 10 ng/kg, a value determined in the BWFS to be protective of both human health (unrestricted reuse) and the environment (ecological receptors). The residual unrestricted cancer risk, based upon a 10 ng/kg cleanup level, would approach the 10^{-6} risk range point of departure (less than 3×10^{-6} unrestricted exposure scenario) and would result in a ecological receptor hazard quotient of less than 1.

The approximate areas to be excavated to attain cleanup, based on both 3.9 ng/kg (1×10^{-6} cancer risk level) and 10 ng/kg, are compared on Figure 2-7. The area of cleanup to 10 ng/kg is approximately 300,000 square feet less than the area to attain cleanup to 3.9 ng/kg. The amount of soil to be removed to attain cleanup to 10 ng/kg is approximately 20,000 cubic yards less than the amount of soil to attain cleanup to 3.9 ng/kg. The excavated soil will be transported off site for disposal in a regulated facility. Following soil excavation, the site will be restored to its current land use.

Physical removal and disposal of dioxin-contaminated soil were completed in August 2004, and the closure report is in regulatory review. The closure report includes characterization of remaining contaminant levels and risk assessment to demonstrate that Site 10 has been remediated to the acceptable risk range.

2.5.6.7 Summary of Rationale for the Selected Remedy

Risk associated with the residual soil contamination at Site 10 is acceptable to human health exposure based on current land use, but potentially unacceptable under an unlikely future unrestricted land-use scenario. Additionally, risk calculated prior to removal was unacceptable to ecological receptors. The site, located between the golf course and the Santa Ana River, is protected from the river floodplain by a flood control berm. The northern portion of the site is currently used as a golf course fairway. The southern portion of the site includes habitat for two

COMPARISON OF AREAS TO BE EXCAVATED BASED ON PRG OF 3.9 ng/kg AND 10 ng/kg IRP SITE 10

Figure 2-7

THIS PAGE INTENTIONALY LEFT BLANK

endangered species, and is bounded by a man-made flood protection levee. The most likely future use is as a golf course fairway north of the base boundary or industrial/commercial-related uses; the southern portion, south of the golf course, is open space.

The combined child/adult surface soil excess cancer risk is 1.9×10^{-5} for unrestricted land use, above the 10^{-6} point of departure for determining remediation goals, and the child blood-lead level is predicted to be 9.4 µg/dL. Child and adult HIs are less than 1. Soil contamination concentrations in native habitat exceed levels protective of endangered species. The off-base portion of the site is open space with unrestricted public access. Based on these considerations, the selected remedy is excavation and removal of soil containing dioxins in excess of 10 ng/kg for both the on-base and off-base portions of Site 10. The U.S. EPA residential PRG is 3.9 ng/kg for dioxins, while the Site 10 ERA indicates that 10 ng/kg would be protective of ecological receptors. Cleanup to 3.9 ng/kg would be considerably more expensive with only a very marginal reduction in residual risk. Following completion of the removal to 10 ng/kg, the exposure point concentration for the remaining dioxin contamination will approach 3.9 ng/kg, thereby addressing the human health concern. The 10 ng/kg cleanup goal for the site will, therefore, minimize the impact to endangered species habitat but, at the same time, be protective of human health and ecological receptors.

This remedy is protective of human health, the environment, and biological receptors through removal of dioxin-contaminated soil exceeding 10 ng/kg and collaterally the metals that exceed residential PRGs. Removal will ensure long-term protectiveness through containment of the soil in an off-site facility subject to long-term maintenance and control, precluding the possibility for exposure. Short-term protectiveness will be achieved through proper soil handling (e.g., dust control) and worker personal safety precautions during excavation and transport of the soil. There will be a short term, managed risk to the community due to the increased truck traffic. ARARs for dust control, worker protection, and soil disposal will be addressed through proper soil handling procedures. The soil is not a designated waste, and land disposal requirements will not be triggered. The remedy is readily implementable using standard construction equipment. The selected remedy does not involve treatment, and contaminant concentrations do not require

treatment under state and federal waste management regulations. The remedy will be cost effective.

Physical removal and disposal of dioxin-contaminated soil were completed in 2004, and the closure report is in regulatory review.

2.5.6.8 Expected Outcome of the Selected Remedy

Implementation of the selected remedy at IRP Site 10 will allow for unrestricted reuse of the site. Physical removal and disposal of dioxin-contaminated soil were completed in 2004, and the closure report is in regulatory review.

2.5.7 IRP Site 17 - Drummed Waste Storage Area/Waste Fuel and Solvent Sump

2.5.7.1 Site History

IRP Site 17 is located in the southwestern corner of the former IWTP compound (see Figure 1-2). Although Site 17 is part of the CERCLA ROD, as part of the former IWTP, Site 17 is undergoing RCRA closure as part of the corrective action termination of the RCRA interim status facility (two separate processes). The former IWTP treated industrial wastewater from the repair of military aircraft from 1960 to 1993. Most of the IWTP facility was removed in 1995 (GEC Environmental Consultants, Inc., 1993a; Tetra Tech, Inc., 1994, 1996). IRP Site 17 is comprised of two connected brick-lined sumps that the Air Force constructed during the early 1960s for the purpose of burning waste fuels and solvents. The Air Force initiated burning, but in 1961 permission for continued burning was denied by local air quality authorities. Therefore, the sumps were used for waste destruction for a limited time but were used primarily as holding tanks for the IWTP and as an oil/water separator until 1985. The area immediately south of the sumps was also used for storage of solvent and plating wastes contained in 55-gallon drums.

Site 17 was subject to a series of site investigations initiated in 1984. IRP investigators sampled the site for metals, semivolatile organic compounds (SVOCs), PCBs, and VOCs. VOCs, particularly TCE, were the only contaminants reported. Site investigations have identified a zone of fine-grained soils, 25 to 55 feet bgs, that underlie and overlie two zones of coarser-grained soils (CDM, 1996g). An EE/CA (CDM, 1997b) prepared for Site 17 presented a detailed analysis of

the subsurface conditions at the site. In summary, there are two water-bearing zones below the Site 17 area. The first zone is a perched groundwater layer that is supported by a layer of finer-grained silts and clays extending from approximately 25 to 55 feet bgs. Collectively, the zone of finer-grained soils starting at 25 feet bgs and the perched groundwater supported by the finer-grained soils is termed the "perched zone." Below the zone of finer-grained soil material is the second zone, termed the "upper aquifer." The upper aquifer comprises sands and gravels that extend to at least 500 feet below the site. During the early 1980s, the top of the upper aquifer was in contact with the zone of finer-grained soil material at 50 feet bgs. Between 1984 and 1988, the elevation of the upper aquifer dropped 7 to 10 feet, below the soil layer of the perched zone. Between 1988 and 1993, the water elevation decreased another 15 to 25 feet, resulting in several dry monitoring wells. The depth to groundwater in the upper aquifer now ranges from approximately 75 to 90 feet bgs (depending on seasonal fluctuations) in the area of IRP Site 17.

TCE has been detected in the perched-zone groundwater in excess of the MCL, but not in the upper aquifer below Site 17. The perched zone currently is dry and is being sampled for soil vapor (Earth Tech, 2001c).

Soil samples have been collected from the surface to approximately 40 feet bgs at the site to determine the TCE source. TCE was detected in the perched zone between 25 and 30 feet bgs (CDM, 1996g). Based on the results of the soil borings, the area of affected soil covers approximately 1,000 square feet.

The perched-zone groundwater contamination is assumed to have resulted from the former chemical waste storage at Site 17. The source may have been from the drums of waste solvents once stored at Site 17 or leakage from the Site 17 sumps. Due to the sandy nature of the surface soils, the solvent migrated downward to the perched zone, where further downward migration was retarded by the finer-grained soils.

The Site 17 EE/CA (CDM, 1997b) evaluated potential migration of TCE from the perched zone into the upper aquifer. The modeling assumed future reuse as a golf course fairway and included infiltration due to irrigation. The modeling indicated that TCE and 1,2-dicloroethene (DCE) will eventually leach into the upper aquifer, but at concentrations well below their respective MCLs.

The Site 17 AM (USAF, 1997e) identified continued groundwater monitoring of the site, along with installation of two additional monitoring wells in the upper aquifer. The wells were installed in 1998 (CDM, 1998b, 1999), and TCE has not been detected in the upper aquifer above 1 microgram per liter (µg/L).

The two sumps, which were part of the IWTP, were removed in 2003, and the CERCLA closure report is in preparation.

2.5.7.2 Current and Potential Future Site Use

The site is currently not being used. The property is zoned industrial/commercial by the city of San Bernardino. Projected long-term use of the site is expected to be as industrial/commercial-related options for the property.

2.5.7.3 Summary of Site Risk

The BWFS concluded that IRP Site 17 does not pose adverse risk to human health or the environment because there is no exposure pathway for the low levels of residual VOC contamination located at approximately 30 feet bgs, i.e., there is no direct contact pathway with receptors on the ground surface. Also, modeling and 11 years of monitoring data show no impacts to the upper groundwater aquifer. The BWFS recommended the removal of the concrete sumps based on RCRA closure requirements to remove all waste management facilities.

The two sumps, which were part of the IWTP, were removed in 2003, and the CERCLA closure report is in preparation.

2.5.7.4 Remedial Action Objectives

As stated in Section 2.5.8.1, Site History, Site 17 is part of the RCRA interim status facility corrective action termination process. The RAOs for IRP Site 17 are intended to integrate both the CERCLA response and RCRA corrective action obligations, which are two separate processes (Norton FFA, Section 17):

- Removal of the sumps (RCRA obligation).

The two sumps, which were part of the IWTP, were removed in 2003, and the CERCLA closure report is in preparation.

2.5.7.5 Analysis of Alternatives

TCE has been detected in perched zone groundwater at Site 17. However, the perched zone is currently dry, and TCE is observed at low concentrations (about 1 µg/L) in soil gas samples collected from the dry monitoring wells. The fine-grained soils that support the perched groundwater are located approximately 30 feet bgs, about 40 feet above the upper aquifer. Due to the depth of the contamination, the site does not pose a direct contact risk under any reuse scenario. The perched-zone groundwater is not a viable drinking water source, is not hydraulically connected with the regional aquifer, and has been dry since 1999. The cause of this contamination could be TCE-contaminated soil in the area, or residual contamination from the former chemical-waste storage sump in the area. No previous removal actions have been taken.

Alternative 1 (NFA) is protective of human health and the environment. Numeric modeling of the site contaminants predicted no discernible impact to the upper aquifer (CDM, 1996g), a result that is supported by 11 years of upper aquifer groundwater data. NFA does not address the RCRA requirement to remove the sumps.

Alternative 2 (ICs) would add no additional protection, because there is no exposure pathway from the low levels of residual VOC contamination.

Alternative 3 (Containment) is not applicable to this site. Soil contamination is 30 feet bgs, and does not appear to be threatening upper aquifer groundwater quality.

Alternative 4 (Removal), using either SVE or perched-zone dewatering (assuming that the perched zone is recharged by rainfall or changes in golf course irrigation practices) could reduce the mass of contaminants existing at the site. However, since there are no completed exposure pathways, removal would not result in any additional protection to human health or the environment.

The concrete structure that forms the Site 17 sumps is not considered the source of the contamination. The sumps, which were part of the IWTP, were removed in 2003, and the CERCLA closure report is in preparation.

2.5.7.6 Description of the Selected Remedy

As part of the corrective action termination of the RCRA interim status IWTP facility, the concrete structure that formed the Site 17 sumps was removed and disposed off site in a permitted facility in 2003, and the CERCLA closure report is in preparation.

2.5.7.7 Summary of Rationale for the Selected Remedy

Contamination at Site 17 is located within a clay layer found at approximately 30 feet bgs. Perched-zone groundwater (when present) is not a drinking water source. Perched-zone groundwater contaminant concentrations do not threaten the quality of the underlying aquifer above drinking water standards. The long-term reuse of the site is projected to be industrial/commercial-related, which is consistent with city of San Bernardino zoning. Because the perched zone is currently dry and the contaminant threat low, there are no viable human health and environmental concerns for Site 17.

The selected remedy for Site 17 is to remove the concrete structure that formed the Site 17 sumps. The remedy is based on RCRA requirements to remove all waste management facilities for corrective action termination. The remedy is not based on human health or environmental protection considerations. The concrete will be disposed off site in a permitted facility, thus providing long-term effectiveness. Short-term protectiveness will be achieved through proper handling (e.g., dust control) of the concrete and worker personal safety precautions during excavation and transport of the soil. There will be a short-term, managed risk to the community due to the increased truck traffic. ARARs for dust control, worker protection, and concrete disposal will be addressed through proper soil handling procedures. The concrete is not a designated waste, and land disposal requirements will not be triggered. The remedy is readily implementable using standard construction equipment. The selected remedy does not involve treatment, and contaminant concentrations do not require treatment under state and federal waste management regulations. Following removal of the concrete, NFA will be required for Site 17 to

protect human health and the environment due to the small size of the site (1.0 acre) and the depth of residual soil contamination (30 feet bgs). No threat exists to the upper aquifer groundwater quality, and there is no opportunity for exposure to the site contaminants. No ARARs are related to the NFA decision, and reduction of TMV through treatment is not applicable to this site. The remedy is readily implementable and cost effective.

The sumps, which were part of the IWTP, were removed in 2003, and the CERCLA closure report is in preparation.

2.5.7.8 Expected Outcome of the Selected Remedy

Implementation of the selected remedy at IRP Site 17 will allow corrective action termination for the IWTP RCRA facility and unrestricted reuse of the site. The sumps, which were part of the IWTP, were removed in 2003, and the CERCLA closure report is in preparation.

2.5.8 IRP Site 19 – Drum Storage Area No. 1

2.5.8.1 Site History

Site 19, located in the CBA to the south of Building 763 (see Figure 1-2), was formerly used as a drum storage area and aircraft washing facility. Drums of fuels, oils, electroplating solutions, TCE and trichloroethane (TCA) sludge, and cyanide waste solutions were stored on an unpaved fenced lot. The area south of Building 763 was the general location of the original aircraft washing facility. This facility was removed in 1966, and the area was resurfaced with 20 inches of concrete to become part of the flight line. Site 19 was investigated during the 1984 to 1986 IRP and the 1991 to 1993 RIs. PCBs were detected in excess of residential PRGs, primarily in the upper 6 inches of soil beneath the concrete runway apron. Figure 2-8 illustrates the extent of the approximately 60,000 square feet of PCB-affected soil at IRP Site 19.

An interim ROD (USAF, 1997c) was developed for IRP Site 19 to identify a use restriction documenting the presence of the contamination. This ROD and its decision for IRP Site 19 will supersede the interim ROD. No groundwater contamination is associated with this site.

FORMER NORTON AIR FORCE BASE

Figure 2-8

2.5.8.2 Current and Potential Future Site Use

The long-term future land use for Site 19 is to retain the runway apron for use by the SBIAA airfield.

2.5.8.3 Summary of Site Risk

The BWFS concluded that there is currently no exposure pathway to residual PCB contamination because of the runway apron concrete cover. The BWFS risk assessment calculated theoretical risks based upon removal of the runway apron. The BWFS concluded that, although the cancer risk and adult non-cancer HI were acceptable, the child non-cancer risk was unacceptable for unrestricted reuse. In addition, the unrestricted cancer risk approaches the high end of the acceptable risk management range of 1×10^{-4} to 1×10^{-6}. Table 2-15 summarizes the BWFS risk analysis results.

Table 2-15

Summary of Site 19 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	0 to 6.5	1.8	6.8×10^{-6}	0.48	3.5	PCBs	Acceptable risk under industrial reuse scenario
Unrestricted	0 to 6.5	1.8	5.8×10^{-5}	14	5.2	PCBs, Arsenic, Cadmium	Cancer risk is within risk management range; adult non-cancer HI risk is acceptable (0.67); child non-cancer HI risk >1; blood-lead level less than 10 µg/dL target.

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

bgs = below ground surface
HI = Hazard Index
PCB = polychlorinated biphenyl
µg/dL = micrograms per deciliter

2.5.8.4 Remedial Action Objectives

RAOs for IRP Site 19 are:

- Limit use of property to prevent exposure to PCB-contaminated soil under an unrestricted land use scenario.

2.5.8.5 Analysis of Alternatives

At present, Site 19 is part of the airfield portion of the base that has been conveyed for use for airport purposes under an FAA covenant that allows only industrial, commercial, and airport support activities. This site, located beneath a runway apron and 20 to 24 inches of concrete, has shallow soil contaminated with PCBs and fuels. The Air Force issued an interim ROD that identified leaving the concrete in place to prevent exposure to the contaminants as the preferred alternative (USAF, 1997c). There is currently no direct contact risk at this site. Assuming the concrete cover were to be removed and exposure to contaminated soil allowed, the cancer risk to site workers would be 6.8×10^{-6}, within the lower end of the risk management range. The industrial HI is 0.48, and the adult blood-lead level is predicted to be 3.5 µg/dL, both acceptable values. Under the unrestricted land use scenario, the cement cover would be removed, allowing for exposure. The predicted cancer risk under the unrestricted land-use scenario is 5.8×10^{-5}, the higher end of the risk management range of 1×10^{-4} to 1×10^{-6}. The unrestricted child non-cancer HI is 14, and the child blood-lead level is 5.2 µg/dL. PCBs are the COC contributing mostly to the unacceptable HI of 14.

Under Alternative 1 (NFA), only construction workers would be exposed as long as the FAA airport restrictions remain in place. Only through changes in the airport status could an exposure to soil contaminants at unacceptable concentrations occur under an unrestricted land-use scenario. Site preparation and other redevelopment activities could lead to disruption or removal of the concrete cover. No long-term effectiveness or permanence would be provided if the airport covenants were rescinded.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing for limitations on land use that "run with the land." ICs would prohibit unrestricted reuse of the site, notify others about the presence of the soils contamination, and allow for access

for inspection of ongoing land-use activities. The ICs would address the entire 1.8-acre site. Any changes in land use that would involve removal of the concrete cover would require that an appropriate RA be taken to address the shallow soil contamination. There are no short-term concerns with this alternative.

Alternative 3 (Containment), using the existing concrete, would protect human health and the environment by ensuring the existence of a barrier to human or animal contact with the contaminated soil. There are no ARARs specific to containment using the existing concrete cover.

Alternative 4 (Removal) would provide long-term effectiveness and permanence by removing contamination from the site, but not without significant costs. Removal would not be warranted unless the concrete cover no longer served its intended purpose for aircraft parking. Short-term impacts due to soil excavation would need to be managed to protect workers and the public. Long-term effectiveness of this remedy would be transferred to the facility receiving the waste, but removal of the contaminated soil could be accomplished to allow unrestricted land use. A soil removal action could be implemented to address ARARs for soil excavation, transport, and disposal, and would take less than 1 month to complete. Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV.

2.5.8.6 Description of the Selected Remedy

The selected remedy for IRP Site 19 is ICs as detailed in Section 2.3.4.2. The land is protected by an FAA covenant that allows only industrial, commercial, and airport support activities. The ICs will be implemented to fulfill the following use limitations:

- Grantee covenants and agrees that it will not use IRP Site 19 for residential purposes, hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children.
- Grantee covenants and agrees that it will not conduct or allow others to conduct activities that limit access to the site for inspections.

2.5.8.7 Summary of Rationale for the Selected Remedy

Site 19 is currently buried beneath 20 to 24 inches of concrete that serves as a ramp area for aircraft parking. The most likely future use of the site is parking for aircraft being repaired in the adjacent Building 763 hangar. There is no risk to human health as long as the concrete remains in place. The concern for the site is the uncontrolled removal of the concrete cover and then unrestricted reuse of the property. If the concrete cover were removed, the combined excess residential cancer risk is estimated to be 5.8×10^{-5}, which is approaching the upper limit of the risk management range of 1×10^{-4} to 1×10^{-6}. The non-cancer HI under an unrestricted land-use scenario is 14 for a child exposure.

The selected remedy is ICs that will notify others about the contaminated soil beneath the concrete cover and prohibit the unrestricted reuse of the property. The selected remedy is protective of human health and the environment by establishing an IC controlling use of, and exposure to, the soil at the site. The ICs will ensure long-term protectiveness through preventing unrestricted exposure to the contaminated soils. Short-term exposure is within the acceptable risk range. The remedy is readily implementable and cost effective using the property transfer process that is currently being employed at the former base. The selected remedy does not involve treatment, because contaminant concentrations do not require treatment under state and federal waste management regulations.

2.5.8.8 Expected Outcome of the Selected Remedy

Implementation of the selected remedy at IRP Site 19 will allow for most likely current and future reuse plans for the site. Unrestricted land use will be prohibited in accordance with the ICs, deed restrictions, and State LUC.

2.5.9 AOC 4 – Building 301

2.5.9.1 Site History

Building 301, located in the NBA near U and 102nd streets, was an equipment and vehicle washing facility (see Figure 1-2). During the 1950s, the building was part of a spray painting facility. At the time of base closure (1994), it was used by civilian auto hobby personnel.

AOC 4 consists of the foundation of former Building 301, an adjacent washing slab, and adjacent soil areas.

A separator/dosing chamber was removed and its location evaluated as part of the basewide underground storage tank (UST) program (Bechtel Environmental, 1997). A solids collection pit and two trench drains were identified during the site investigation. The concrete washing slab was heavily stained, particularly near the trench drains. Drums of oil and other materials were stored in sheds along the southern drain line. A 4-foot- by 4-foot-wide area surrounded by a 6-foot-tall chain-link fence is located to the north of the washing slab and may represent the location of a former waste receptacle. The area is capped with a wooden cover, and the material under the cover may be fill.

Sampling results during the CS and ESI indicated the presence of VOCs, PAHs, fuels, and metals in soils at AOC 4. However, only antimony (34.6 mg/kg), arsenic (30.1 mg/kg), cadmium (80.7 mg/kg), and lead (8,460 mg/kg) exceeded residential PRGs. The contaminants are limited to near-surface depths (less than 1 foot bgs) and are not widespread horizontally (Figure 2-9).

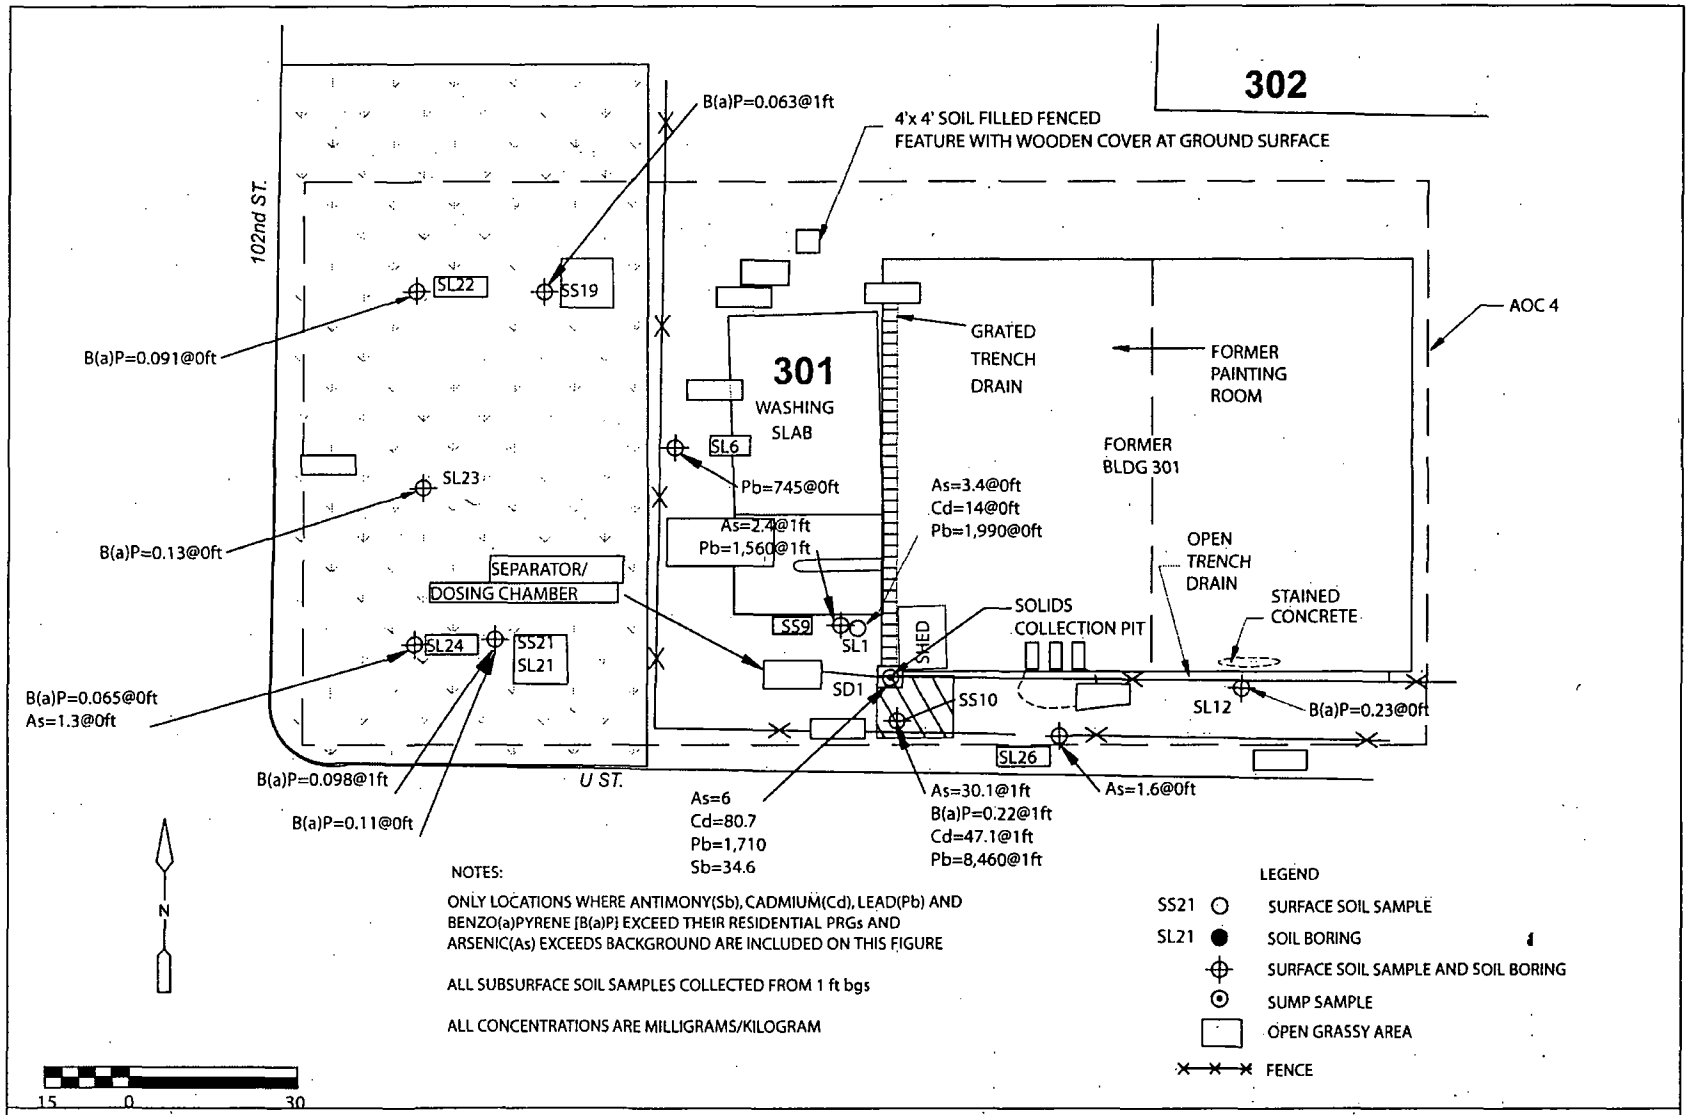
The area of affected soil is approximately 40 feet by 120 feet. No groundwater contamination is associated with this AOC.

AOC 4 is on a parcel that was transferred by SBIAA to the San Bernardino County Fire Department under an FAA covenant that allows only industrial, commercial, or aircraft support usage. The Fire Department has refurbished Building 302 for office use and vehicle repair and is using the area west of the building (north of AOC 4) as a household hazardous waste collection point.

Remedial alternatives were evaluated in an EE/CA (CDM, 1997a). The Air Force identified ICs as the preferred alternative in the AM (USAF, 1997a).

2.5.9.2 Current and Potential Future Site Use

Paved areas south of Building 302 are being used for vehicle and equipment storage. The western half of AOC 4 is covered by grassy weeds, while the eastern half is paved and includes a covered storage area. The Fire Department plans to use the paved area for equipment storage,



AOC 4
LOCATIONS WHERE CONTAMINANTS EXCEED RESIDENTIAL PRGs AND BACKGROUND IN SOIL

NortonROD/008

while there are no plans for use of the grassy area of AOC 4 outside of the fenced storage yard. The property is currently zoned industrial/commercial by the city of San Bernardino. Projected long-term use of the site is expected to be industrial/commercial-related options for the property.

2.5.9.3 Summary of Site Risk

The BWFS concluded that AOC 4 does not pose an unacceptable risk to human health using the industrial reuse scenario. Also, the unrestricted cancer risk and adult non-cancer HI were acceptable; however, the child non-cancer risk and child blood-lead levels were unacceptable for unrestricted land use. Table 2-16 summarizes the BWFS risk assessment for AOC 4.

Table 2-16

Summary of AOC 4 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	0 to 1	0.1	2.3×10^{-6}	0.03	12.8	lead, arsenic, PAHs	Acceptable risk under industrial reuse scenario.
Unrestricted	0 to 1	0.1	2.6×10^{-5}	1.4	40.8	lead, arsenic, PAHs cadmium	Cancer risk is within risk management range; adult non-cancer HI risk is acceptable (0.075); child non-cancer HI risk >1; child blood-lead level exceeds 10 µg/dL target.

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

2.5.9.4 Remedial Action Objectives

There are no RAOs for AOC 4 since there is no unacceptable risk to human health. The property has been transferred under an FAA covenant that allows only industrial, commercial, or aircraft support usage.

2.5.9.5 Analysis of Alternatives

Surface and shallow subsurface soils at this site are contaminated with PAHs and metals; there is currently no cover. The estimated cancer risk using the industrial use scenario and assuming daily exposure, is 2.3×10^{-6}, near the lower concentrations of the risk management range of 1×10^{-4} to 1×10^{-6}. The adult non-cancer HI is 0.03. The predicted unrestricted adult blood-lead level is 12.8 µg/dL, exceeding the 10 µg/dL. This is presented for comparison purposes for the industrial scenario. The predicted adult blood-lead levels in an industrial scenario would be lower.

AOC 4 is within a land parcel that has been transferred under an FAA covenant that allows only industrial, commercial, and aircraft support activities. All types of unrestricted reuse activities are precluded by the covenant.

Alternative 1 (NFA) is protective due to the already in place land-use restrictions. Based on the current deed restrictions, the property will revert back to the Federal government should the airport no longer be deemed as a viable use for the former base.

Alternative 2 (ICs) would not add any meaningful protection to human health and the environment. The property has been deeded to SBIAA with FAA covenants that prohibit unrestricted land use, and return of the property to federal ownership would be required if no longer used as an airport.

Alternative 3 (Containment) is not applicable to this site other than covering the site with asphalt or concrete.

Alternative 4 (Removal) could provide additional long-term effectiveness and permanence by removing the contamination from the site but with additional costs. In addition, removal is not justified given the current and future reuse of the property. The removal alternative could be implemented to meet soil excavation, transport, and disposal ARARs. The potential for short-term exposure of workers and the community would need to be controlled for any removal action. Due to the small size of the site, removal would require less than a week to accomplish.

Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV.

2.5.9.6 Description of the Selected Remedy

The selected remedy for AOC 4 is NFA. Residual contamination at AOC 4 exceeds unrestricted use levels. Restrictions are included in the FAA transfer document, and in city zoning provisions. In addition, SLUC regulation 22 CCR 67391.1(b), which has been identified as an ARAR, specifies the execution of a SLUC which provides DTSC with an enforcement mechanism to assure compliance with the restriction on residential and sensitive uses. The FOST for this property was signed on September 11, 1997, and the property was transferred to SBIAA by the Air Force on April 1, 2001. The 5-year review will also ensure that the land use controls remain effective. The State of California may pursue the SLUC to:

- Prohibit use of AOC 4 for residential purposes, hospitals for human care, public or private schools for persons under 18 years of age, or day-care centers for children and prohibit activities that limit access to the site for inspections.

2.5.9.7 Summary of Rationale for the Selected Remedy

Portions of AOC 4 are currently being used to store equipment; therefore, site contaminants pose minimal threat due to limited activity. The projected long-term use is for equipment storage. The concern for the site is reuse of the soil or a land-use change to unrestricted, allowing for frequent soil exposure, a scenario currently prohibited by the FAA airport use covenant.

Existing land-use restrictions and the SLUC for the parcel in which AOC 4 is located will be effective in protection of human health and the environment in that they will prevent reuse of the property in an unrestricted land use scenario. The selected remedy does not involve treatment, because contaminant concentrations do not require treatment under state and federal waste management regulations. The remedy is cost-effective because the controls are already in place.

2.5.9.8 Expected Outcome of the Selected Remedy

The selected remedy will allow for reuse of AOC 4 in accordance with the previously established deed restriction.

2.5.10 AOC 18 – Buildings 451 and 452

2.5.10.1 Site History

Former Buildings 451 and 452 were located in the CBA, east of Tippecanoe Avenue and north of Harry Sheppard Boulevard (see Figure 1-2). Building 451 was a former garage and gas station in operation from 1942 to the late 1960s or early 1970s; Building 452 was the site of USTs. A 1942 site drawing indicates five 12,000-gallon gasoline USTs, a fueling station, and an oil storage house (Buildings 452, 451, and 450, respectively), although a 1967 site drawing indicates only two 12,000-gallon USTs were present. All structures and USTs have been removed.

AOC 18 was investigated during the CS and ESI. Sampling results indicated the presence of xylene and naphthalene at concentrations exceeding residential PRGs at a depth of 10 feet bgs. The soil contamination covers an area of approximately 600 feet.

Prior to the initial redevelopment activities, AOC 18 was covered by an asphalt-paved parking lot that served the adjacent base post office. From January 2000 to 2004, the surface of the AOC was bare earth facilitating aeration (volatilization) of the fuel-related chemicals. The site is now paved with asphalt as part of the Mattel warehouse and distribution center.

Remedial alternatives were previously evaluated in an EE/CA (CDM, 1997a). The Air Force identified ICs in the AM (USAF, 1997a) as the preferred RA.

2.5.10.2 Current and Potential Future Site Use

AOC 18 is on property that was transferred to IVDA. IVDA has demolished all structures in the vicinity of AOC 18 and removed all pavement in preparation for redevelopment. The property is currently zoned industrial/commercial by the city of San Bernardino. Projected long-term use of the site is expected to be industrial/commercial-related options for the property.

2.5.10.3 Summary of Site Risk

The BWFS concluded that AOC 18 does not pose unacceptable risk to human health. Table 2-17 summarizes the BWFS risk assessment for AOC 18.

Table 2-17

Summary of AOC 18 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	5 to 10	0.1	1.1×10^{-6}	0.26	--3	benzene, naphthalene	Acceptable risk under industrial reuse scenario.
Unrestricted	5 to 10	0.1	3.2×10^{-6}	1.2	--3	benzene, naphthalene	Cancer risk is within risk management range; adult non-cancer HI risk is acceptable (0.035); child non-cancer HI risk >1

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

[3] Lead is not a COC at AOC 18

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

2.5.10.4 Remedial Action Objectives

There are no RAOs for AOC 18 since there is no unacceptable risk to human health.

2.5.10.5 Analysis of Alternatives

Soil at AOC 18 is contaminated with fuel chemicals found at 10 feet bgs in an area that has been recently paved with asphalt. Projected long-term use is for industrial/commercial development, which is consistent with city of San Bernardino zoning. The current excess cancer risk of 1.1×10^{-6} at this site, using the industrial use scenario and assuming daily exposure, slightly exceeds the target of 1×10^{-6}. The adult non-cancer HI is 0.26, and lead is not a COC.

Assuming indoor inhalation of the volatiles within a new commercial structure and no reduction in contaminant concentration over time, the indoor air inhalation risk to an office worker is predicted to be 3.8×10^{-8}. The unrestricted cancer risk is 3.2×10^{-6} in the lower end of the risk management range of 1×10^{-4} to 1×10^{-6}. The child non-cancer HI is 1.2, again assuming no loss of volatiles when the contaminants are brought to the surface. The risks are likely overstated because the fuel contaminants are volatile and their concentrations in the soil would be reduced (i.e., lost to the atmosphere) if they were to be brought to the surface during site grading/preparation for residential (unrestricted) development. The calculated unrestricted cancer risk of 3.2×10^{-6}, however, is within the risk management range that allows for NFA decisions based on site and risk management considerations.

Alternative 1 (NFA) is protective because the calculated unrestricted risk at AOC 18 approaches the 10^{-6} where remedial actions are not warranted. In addition, the COCs are readily volatile and degradable, and concentrations and corresponding theoretical risks will decrease with time. Long-term effectiveness or permanence would eventually be achieved by natural degradation through aerobic and/or anerobic processes. The contaminant types present can be degraded by soil micro-organisms currently inhabiting the site soil. Monitoring would be possible through installation of soil vapor monitoring wells, but probably is not warranted under current and expected future land-use activities.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing limitations on land use that "run with the land." The ICs would prohibit the unrestricted reuse of the site, notify others about the presence of the soils contamination, and allow access to inspect ongoing land-use activities. The ICs would address the entire 0.1-acre site. There are no short-term concerns with this alternative.

Alternative 3 (Containment), through placement of an asphalt or concrete cover for a road or parking lot, would protect human health and the environment by ensuring the existence of a barrier to human or animal contact with the contaminated soil. Long-term effectiveness could be ensured by use of ICs requiring maintenance of the containment system. There are no ARARs specific to this type of containment action.

Alternative 4 (Removal) would provide long-term effectiveness and permanence through removal of contamination from the site but at significant costs since contaminant concentrations currently are within the acceptable risk range. Short-term impacts due to soil excavation would need to be managed. ARARs for soil excavation, transportation, and disposal could be met. Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV.

2.5.10.6 Description of the Selected Remedy

The selected remedy for AOC 18 is NFA.

2.5.10.7 Summary of Rationale for the Selected Remedy

The fuel-contaminated soils at AOC 18 are buried beneath 10 to 15 feet of soil in an area being redeveloped for industrial/commercial-related purposes, consistent with city of San Bernardino zoning. The residual soil contamination does not pose a significant risk under an unrestricted land-use scenario (combined child/adult cancer risk is 3.2×10^{-6}, approaching the calculated risk where RAs are not warranted); the child non-cancer HI is 1.2.

A selected remedy of NFA is based on: (1) scientific studies that show the petroleum chemicals to be readily degradable in soils, (2) Norton AFB soil data from groundwater and soil actions that show diminishing concentrations of petroleum chemicals and no specific threat to upper aquifer groundwater quality, (3) the depth at which the contaminants are buried, (4) the highly improbable chance for future exposure, and (5) the most likely continued land use under the industrial/commercial reuse scenario. This decision is protective of human health and the environment. Contaminant levels calculated using data from 7 years ago indicate an acceptable direct contact and indoor air inhalation risk. The contaminants are readily degradable, and concentrations have likely diminished. Based on land-use plans, the likelihood of any future exposure is extremely small. The decision does not trigger any ARARs. The decision is protective in the short term, because no activity will be taken to access the residual contamination, thus allowing for exposure during handling and transport. The decision is protective in the long term due to the chemical fate and transport characteristics of the COCs (i.e., diminishing concentrations with time). The chemical degradation process also addresses

the reduction in TMV consideration. The decision is readily implementable and will be cost effective.

2.5.10.8 Expected Outcome of the Selected Remedy

The selected remedy will allow for unrestricted reuse of AOC 18.

2.5.11 AOC 33 – Building 747

2.5.11.1 Site History

Building 747, located in the southeastern corner of the CBA (Figure 1-2), was one of the primary industrial facilities at Norton AFB. Although AOC 33 is part of this CERCLA ROD, as part of the former Industrial Waste Line (IWL), it is also part of the RCRA corrective action termination of the interim status facility (two separate closure processes). The building was constructed in 1942 and renovated in 1944, 1953, and 1955. From 1942 to 1966, the building supported operations for the repair and overhaul of engines and other aircraft parts. Building 747 was converted into a freight terminal facility in 1966, and the building served as offices and storage facilities.

Subsurface soil contamination at AOC 33 is associated with sumps (some recently removed) buried beneath an asphalt access road immediately south of Building 747. The sump portion of AOC 33 is part of the IWL that is undergoing RCRA corrective action termination as an interim status facility. AOC 33 was investigated during the CBA OU RI, CS, and the ESI (CDM, 1992, 1995, 1996c). Sampling results indicated the presence of DCB in excess of industrial and residential PRGs, primarily within the upper 10 feet bgs of soil. No groundwater contamination is associated with AOC 33. Remedial alternatives were evaluated in an EE/CA (CDM, 1997a). The Air Force identified a deed restriction in the AM (USAF, 1997a) as the preferred RA.

The sump and surrounding soil were removed in 2003. Confirmation sampling revealed contaminants of potential concern. In April 2004, to further characterize the site, eight borings were drilled within the excavation, and soil samples were taken to 30 feet bgs; no elevated levels of contaminants of potential concern were detected. Additional sampling (soil gas) was conducted in October 2004.

The CERCLA closure report is in preparation.

2.5.11.2 Current and Potential Future Site Use

AOC 33 is on property that has been leased by the Air Force to SBIAA. Building 747 has been subleased by SBIAA to several entities for commercial use. The property is currently zoned industrial/commercial by the city of San Bernardino. Projected long-term use of the site is expected to be industrial/commercial-related options for the property, including aviation support.

2.5.11.3 Summary of Site Risk

Using the subsurface soil and soil gas data, the cancer risk is 2.7×10^{-4} and the non-cancer HI is 0.078, indicating a cancer risk in excess of 1×10^{-6} and an acceptable non-cancer risk due to the contaminants buried underneath pavement for the commercial/industrial scenario. DCB in shallow soils (soil gas) at AOC 33 poses an unacceptable industrial indoor air risk, and an unacceptable unrestricted child non-cancer risk. Table 2-18 summarizes the BWFS risk assessment for AOC 33.

The sump and contaminated soils were removed in 2003, and the CERCLA closure report is in preparation.

2.5.11.4 Remedial Action Objectives

As stated in Section 2.5.12.1, Site History, AOC 33 sumps are part of the IWL that is part of the corrective action termination of the RCRA interim status facility. The RAOs for AOC 33 are intended to integrate both the CERCLA response and RCRA corrective action obligations, which are two separate processes (Norton Federal Facility Agreement, Section 17):

- Remove the IWL sump (RCRA obligation).
- Remove contaminated soils that pose an unacceptable indoor air inhalation risk (CERCLA/RCRA obligations).
- Reduce the non-cancer risk to an individual to an HI less than 1 ("the NCP non-cancer risk remedial goal").

Table 2-18

Summary of AOC 33 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	1 to 8	0.1	1.1×10^{-6}	0.078	--[3]	dichlorobenzene	Acceptable risk under industrial reuse scenario.
Industrial (air inhalation pathway)	1 to 8	0.1	2.7×10^{-4}		--[3]	Dichlorobenzene	Unacceptable industrial risk under air inhalation pathway.
Unrestricted	1 to 8	0.1	3.6×10^{-6}	3.5	--[3]	dichlorobenzene	Cancer risk is within risk management range; adult non-cancer HI risk is acceptable (0.18); child non-cancer HI risk >1

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

[3] --Lead is not a COC at AOC 33.

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

The sump and contaminated soils were removed in 2003, and the CERCLA closure report is in preparation.

2.5.11.5 Analysis of Alternatives

Solvent contamination associated with a buried sump is present at a depth of 10 feet bgs covered by an asphalt roadway. The industrial and unrestricted land use cancer risks and non-cancer HIs are within the risk management range. The site is included with property that has been transferred under the FAA airport covenant and cannot be used for residential (unrestricted) purposes unless that covenant is changed. Assuming indoor inhalation of the volatiles within a new commercial structure, the modeled indoor air inhalation risk to an office worker is predicted to be 2.7×10^{-4}. This indoor air risk generally warrants an RA. However, the contaminants are semivolatile, and their concentrations would be reduced (i.e., lost to the atmosphere) if the contaminated soils were brought to the surface during site grading/preparation for residential (unrestricted) development. The contaminant concentrations are also expected to slowly diminish in-situ over time due to their volatility and other natural degradation processes.

Alternative 1 (NFA) potentially would not be protective for the short term because it does not address the residual contamination at the site. Long-term effectiveness or permanence would eventually be achieved through degradation of the solvent contaminants. Monitoring of the contaminant degradation rate is possible through placement of probes through the asphalt pavement.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing limitations on land use that "run with the land." The ICs would prohibit unrestricted land use of the site, notify others about the presence of soils contamination, provide for engineered soil vapor control within the foundation of a new building, require maintenance of existing cover (asphalt roadway), and allow access to inspect ongoing land-use activities. The ICs would address the entire 0.1-acre site. There are no short-term concerns with this alternative, as long as the existing asphalt cover remains in place.

Alternative 3 (Containment), consisting of the existing asphalt cover, would protect human health and the environment by providing a barrier to exposure. Long-term effectiveness could be ensured by ICs requiring maintenance of the asphalt. There are no ARARs specific to the containment alternative.

Alternative 4 (Removal) would provide long-term effectiveness and permanence but at a cost greater than ICs. The removal would reduce the inhalation risk predicted by the indoor air model to an acceptable level. Short-term impacts due to soil excavation would require management. The removal alternative could be implemented to address excavation, transport, and disposal ARARs, and could be completed in less than 1 week. Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV.

The sump and contaminated soils were removed in 2003, and the CERCLA closure report is in preparation.

2.5.11.6 Description of the Selected Remedy

The selected remedy for AOC 33 is excavation and removal of the sump and associated soils contaminated with DCB that pose an unacceptable indoor air risk. The sump and contaminated soils were removed in 2003. The CERCLA closure report, which is in preparation, will include characterization of any remaining contaminant levels and risk assessment to demonstrate that AOC 33 has been remediated to the acceptable risk range.

2.5.11.7 Summary of Rationale for the Selected Remedy

Subsurface soil contamination at AOC 33 is associated with sumps (some recently removed) buried beneath an asphalt access road. The current and future use for the site is an access road to Buildings 747 and 749. Both buildings are currently used for warehousing and other industrial purposes and, in the future, may be used for airfield support, which is consistent with city of San Bernardino zoning. The combined child/adult excess cancer risk for exposure to the soil, assuming the asphalt were removed and the soil brought to the surface, is approaching the lower end of the risk management range (3.6×10^{-6}). The child non-cancer HI is 3.5. Indoor air risk modeling predicts an unacceptable risk potential. The most significant risk would occur if a small structure was to be constructed over the site. The contaminants are volatile and degradable, and the concentrations in soil are expected to decrease with time.

Because a majority of the contamination is associated with a buried sump, the selected remedy is a hot-spot removal involving the sump and adjacent soils. Upon removal of the sump and soil, confirmation sampling will be performed to demonstrate that the removal was protective of current and most likely future users. Because the AOC is part of the property transferred under an FAA airport agreement, the only future reuse for the property is that of airport support activities that exclude unrestricted land use.

The selected remedy will target residential (unrestricted) COC concentrations, thereby allowing for unrestricted land use. This remedy is protective of human health and the environment through removal of the location with the highest soil and soil gas concentrations. The remedy will address ARARs involving soil and waste excavation, transport, and disposal, as well as for worker and community protection. The remedy is protective in the short term through

implementation of measures to prevent release of contaminants during waste handling and transport. The remedy is protective in the long term due to the reduction in wastes at the site and the chemical fate and transport characteristics of the COCs that would result in diminishing residual concentrations over time. Soil contaminant concentrations are not sufficient to warrant treatment prior to disposal. Chemical degradation processes will address the reduction in TMV consideration of any waste remaining at the AOC location. The remedy is readily implementable and cost effective.

The sump and contaminated soils were removed in 2003, and the CERCLA closure report is in preparation.

2.5.11.8 Expected Outcome of the Selected Remedy

Implementation of the selected remedy at AOC 33 will allow for unrestricted reuse of the site. The sump and contaminated soils were removed in 2003, and the CERCLA closure report is in preparation.

2.5.12 AOC 39 – Golf Course Storm Drain Outfall Area

2.5.12.1 Site History

AOC 39 is located west of Club House Drive and south of the southern perimeter road (see Figure 1-2), where an underground storm drainpipe empties into a grass-covered fairway drainage ditch. The discharge serves storm drain lines that originate along the southern flight line area. An oil/water separator removes oil prior to discharge into the ditch. The discharge point possibly received waste from the flight line and Buildings 695, 763, and 795. Aerial photographs from the 1950s and later indicate that fluids from aircraft repair and fueling emptied into the storm drain system. A 1982 interview record indicated that flight line oils were occasionally observed in the golf course drain.

Results of sampling during the CS and ESI indicated the presence of PAHs (primarily benzo(a)pyrene) in near-surface soils (less than 1 foot bgs) in excess of residential PRGs, and arsenic in excess of the background concentration. The area of affected soil is 20 feet by 800 feet. No groundwater contamination is associated with AOC 39.

Remedial alternatives of AOC 39 were previously evaluated in an EE/CA (CDM, 1997a). The Air Force selected deed restrictions in the AM (USAF, 1997a) as the preferred RA. AOC 39 was evaluated further in the BWFS.

2.5.12.2 Current and Potential Future Site Use

AOC 39 is on property leased by the IVDA to the Palm Meadows Golf Course. Projected long-term use of the site is expected to be industrial/commercial-related options for the property, consistent with zoning by the city of San Bernardino. The storm water drainage would likely require alteration depending on the type of reuse.

2.5.12.3 Summary of Site Risk

The BWFS concluded that AOC 39 does not pose an unacceptable risk to human health. Table 2-19 summarizes the BWFS risk assessment for AOC 39.

Table 2-19

Summary of AOC 39 Risks – Industrial and Unrestricted Land Use Scenarios

Land Use Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	0 to 5	0.4	1.9×10^{-6}	0.0065	4.1	PAH, arsenic	Acceptable risk under industrial reuse scenario.
Unrestricted	0 to 5	0.4	1.9×10^{-5}	0.29	7.6	PAH, arsenic	Acceptable risk under unrestricted land use scenario

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

2.5.12.4 Remedial Action Objectives

There are no RAOs for AOC 39 since there is no unacceptable risk to human health.

2.5.12.5 Analysis of Alternatives

This site has near-surface soil contaminated with PAHs and metals covered by sod within a golf course fairway. The industrial reuse cancer risk is predicted at 1.9×10^{-6}, near the lower end of the risk management range; the non-cancer HI is 0.0065. Projected long-term plans for the site are for industrial/commercial purposes, consistent with city of San Bernardino zoning. The predicted unrestricted cancer risk is 1.9×10^{-5}, within the middle of the risk management range (between 1×10^{-4} and 1×10^{-6}). The child HI is predicted at 0.29, and the modeled child blood-lead level is predicted to be 7.6 µg/dL. Both the HI and modeled child blood-lead levels are acceptable values. The concentrations of the PAH chemicals may be reduced over time due to natural processes. The arsenic is present in concentrations slightly above background and is not indicative of gross contamination.

Alternative 1 (NFA) is potentially protective under an unrestricted land-use scenario, because the residual cancer risk is within the risk management range, and the area affected and the mass of contaminants is very small.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing limitations on land use that "run with the land." The ICs would prohibit residential (unrestricted) reuse of the site, notify others about the presence of soils contamination, and allow access to inspect ongoing land-use activities. The ICs would address the entire 0.4-acre site. There are no short-term concerns with this alternative.

Alternative 3 (Containment) is not applicable for the site because it would affect the storm runoff drainage.

Alternative 4 (Removal) would provide long-term effectiveness and permanence by removing contamination from the site. Short-term impacts due to soil excavation would need to be managed. ARARs for soil excavation, transportation, and disposal can be met, and removal could be completed in less than 1 week. Restoration of the golf course could be accomplished within a month of excavation. Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV. Additional

protection of human health would be marginal, because the current unrestricted risk is within the acceptable risk range.

2.5.12.6 Description of the Selected Remedy

The selected remedy for AOC 39 is NFA.

2.5.12.7 Summary of Rationale for the Selected Remedy

Surface soil contamination is present in a ditch at AOC 39 that is part of the airfield storm water system. The site is linear, not more than 8 feet wide at its greatest extent. Contamination is shallow, and there is not a significant mass of contamination remaining. The outfall is present within the active portion of the Palm Meadows Golf Course. Most likely, future use of the site will be continued use as a storm drain outfall that serves the adjacent airfield. The concern for the site is a change to an unrestricted land use; this change is currently prohibited by current city of San Bernardino land zoning rules. The combined residential child/adult excess cancer risk is 1.9×10^{-5}, near the mid-point of the risk management range (between 1×10^{-4} and 1×10^{-6}), and the child HI is 0.29. The risk is a result of PAHs and metals in the surface soils. Because the site is linear and site characterization sampling focused only on the outfall drainage, the analytical results are biased, leading to an overestimation of the actual risk. Any exposure to the site area would include clean soils adjacent to the drainage, which are not affected by the outflow.

NFA is protective of human health and the environment because current risk is minimal and within the risk management range. The selected remedy does not involve treatment, but contaminant concentrations do not require treatment under state and federal waste management regulations. The remedy for AOC 39 is cost effective.

2.5.12.8 Expected Outcome of the Selected Remedy

The selected remedy will allow for unrestricted reuse of AOC 39.

2.5.13 AOC 70 Former IWTP Effluent Percolation Pond

2.5.13.1 Site History

AOC 70 was a percolation pond used for treated IWTP effluent during the mid-1980s to 1993 (see Figure 1-2). Although AOC 70 is part of this CERCLA ROD, as part of the former IWTP, AOC 70 also must be closed as part of the RCRA corrective action termination of the interim status facility (two separate closure processes). On December 31, 2004, DTSC-RCRA acknowledged that AOC 70 was clean closed (DTSC, 2004). The 0.25-acre pond site was constructed upon sandy soils that readily facilitated infiltration of the treated effluent into the subsurface. There was no outflow from the pond. The pond dried out when the IWTP ceased functioning in mid-1993. AOC 70 was investigated under the CS Addendum No. 2 (CDM, 1996b), and results of sampling indicated the presence of PAHs, pesticides, PCBs, and metals. Petroleum contamination was encountered during installation of a new sewer pipeline along the northern edge of Palm Meadows Drive.

RAs were evaluated in an EE/CA (CDM, 1997a). The Air Force selected a soil removal action in the AM (USAF, 1997a) as the preferred remedy. The Air Force completed the removal action in 1997 and backfilled the site with certified clean fill (Bechtel Environmental, 1997). Benzo(a)pyrene and benzo(k)fluoranthene were detected in two of the confirmation samples at concentrations below their residential PRGs, and PCBs were detected in one confirmation sample slightly above the residential PRG. The affected area is less than 1,000 square feet. No groundwater contamination is associated with the AOC.

2.5.13.2 Current and Potential Future Site Use

AOC 70 is within a parcel of the base that has been leased to IVDA. The property is currently zoned industrial/commercial by the city of San Bernardino. Projected long-term use of the site is expected to be as industrial/commercial-related options for the property consistent with city of San Bernardino zoning.

2.5.13.3 Summary of Site Risk

The BWFS concluded that AOC 70 does not pose an unacceptable risk to human health. Table 2-20 summarizes the BWFS risk assessment for AOC 70.

Table 2-20

Summary of AOC 70 Risks – Industrial and Unrestricted Land Use Scenarios

Reuse Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	5 to 10	0.1	1.1×10^{-7}	0.0024	--[3]	PAHs	Acceptable risk under industrial reuse scenario.
Unrestricted	5 to 10	0.1	1.2×10^{-6}	0.1	--[3]	PAHs	Acceptable risk under unrestricted land use scenario

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

[3] Lead is not chemical of concern at AOC 70.

bgs = below ground surface
HI = Hazard Index
PAH = polynuclear aromatic hydrocarbon
µg/dL = micrograms per deciliter

2.5.13.4 Remedial Action Objectives

There are no RAOs for AOC 70 since there is no unacceptable risk to human health or the environment.

2.5.13.5 Analysis of Alternatives

AOC 70 has 3 to 10 feet of backfill soil covering subsurface soil contaminated with PCBs and PAHs. The industrial reuse cancer risk is 1.1×10^{-7}, and the adult HI is 0.0024. The unrestricted cancer risk is 1.2×10^{-6}, within the low end of the risk management range of 1×10^{-4} to 1×10^{-6}, and the child HI is 0.1. Projected long-term plans for the site are industrial/commercial-related use, which is consistent with city of San Bernardino zoning.

Alternative 1 (NFA) is currently protective because the cancer risk is less than 1 x 10^{-6} and the hazard index is less than 1. The risk is probably less than predicted because the risk does not factor in the backfill soil covering the two small areas of contamination, and because the risk analysis does not account for the size of the site and the extent to which clean soil has been used to backfill the original excavation.

2.5.13.6 Description of the Selected Remedy

The selected remedy for AOC 70 is NFA.

2.5.13.7 Summary of Rationale for the Selected Remedy

AOC 70 contains soil contaminated by PAHs buried beneath approximately 3 to 10 feet of backfill soil. The combined child/adult excess cancer risk (1.2 x 10^{-6}) is in the acceptable risk management range for unrestricted reuse. The child non-cancer HI is 0.1. The most likely reuse of the site is as commercial/industrial development being considered by the IVDA consistent with city of San Bernardino zoning.

NFA is protective of human health and the environment due to the small size of the site (0.1 acre) and contamination is buried approximately 3 to 10 feet bgs. It is highly unlikely that the risk scenario used to develop the site risk (including duration and frequency of exposure) is relevant based on the size of the site and distribution of contaminants. The prior removal action is protective of human health and the environment in the long and short term. There are no ARARs related to this decision, and treatment of the remaining contaminants at the site is not warranted under waste management regulations. The preferred decision is readily implementable and cost effective.

2.5.13.8 Expected Outcome of the Selected Remedy

The selected remedy will allow for unrestricted reuse of AOC 70.

2.5.14 Building 752 Exterior Radium Spill

2.5.14.1 Site History

Building 752 is located in the eastern portion of the CBA adjacent to the airfield (see Figure 1-2). The building was used during the 1940s and 1950s for the repair of aircraft instruments, including painting instrument dials with radio-luminescent paint containing radium-226. The room used for painting dials was sealed in 1955 when painting operations ceased. During the period that painting occurred, paint waste was flushed into a sink connected to the sanitary sewer. Investigations of the sink and piping system showed that they were contaminated by radium-226. This included the piping system outside of the building to where it connected with the sanitary sewer. Cleanup of the interior piping system and interior surfaces of Building 752 were handled under separate programs. Cleanup of soils affected by radium-226 waste outside of Building 752 are being addressed in this ROD.

To determine whether soils outside of the building had been affected by the discharge of paint waste into the sanitary sewer pipe, the pipe was excavated for visual characterization and soil sampling. The pipe was constructed of 6-inch vitreous clay in 3-foot sections. Two soil samples collected as part of the initial site characterization were found to contain radium-226 at 169 ±10 picoCuries per gram (pCi/g) and 1,940 ±20 pCi/g (background is 1.41 pCi/g). The entire waste line piping was surveyed with a field instrument and found to exhibit gamma radiation above background levels.

Excavation of the piping system was conducted July 23 through August 1, 1996. The excavation was approximately 3 feet deep where the waste line exited the southwest corner of the building, and extended to a depth of 9 feet where the waste line entered the sanitary sewer. All excavated soil and piping was disposed off site (IT Corporation, 1999).

A total of 40 confirmation soil samples were collected at approximately 10-foot intervals before backfilling and analyzed for radium-226. Detections ranged between 0.84 and 6.5 pCi/g. The mean concentration of the samples was 1.7 pCi/g (IT Corporation, 1999). The Norton AFB background level for radium is 1.41 pCi/g. Before backfilling the trench, a new waste line was

installed between the building and the sanitary sewer. After backfilling the trench, asphalt pavement was placed over the excavation.

As part of the overall radium-226 investigation of the Building 752 area, additional radium-226 contamination was discovered in an area immediately west of the building. Building drawings from the 1950s indicate a wooden loading dock attached to the building over the affected area. In February 2001, the loading dock area was sampled for radium-226. Fourteen samples were collected, and radium-226 ranged between 10 and 240 pCi/g. The investigators determined that the area of concern is 11 by 55 feet, with depth of contamination between 1 and 4 feet bgs (USAF, 2001). The estimated volume of affected soil is 1,400 cubic feet.

Radium-226 contaminated soil was removed in 2004. The closure report is in preparation. All contaminated soil will be properly disposed.

2.5.14.2 Current and Potential Future Site Use

Currently the site is not in use. The property is currently zoned industrial/commercial by the city of San Bernardino. Projected long-term use of the building and surrounding area is expected to be industrial/commercial-related options for the property (airfield support).

2.5.14.3 Summary of Site Risk

The BWFS concluded that the cancer risk due to residual radium-226 is at the high end of the acceptable range for industrial reuse and unacceptable for unrestricted reuse. Table 2-21 summarizes the BWFS risk assessment for the Building 752 radium paint spill. Removal of contaminated soil was completed in 2004, and the final closure report is in preparation.

2.5.14.4 Remedial Action Objectives

The RAOs for Building 752 Radium Spill are:

- Reduce the lifetime excess cancer risk to an individual of between 1 x 10-4 and 1 x 10-6 using 1 x 10-6 as the point of departure for the remediation goal ("the NCP cancer risk remedial goal").

Table 2-21

Summary of Building 752 Risks – Industrial and Unrestricted Land Use Scenarios

Reuse Scenario	Depth Interval Exhibiting Contamination (feet bgs)	Affected Area (acres)	Cancer Risk[1]	Non-cancer Risk[1]	Blood-Lead Level[2] (µg/dL)	COC Risk Drivers	Comments
Industrial	0 to 3	0.01	4.7×10^{-5}	--	--[3]	Radium 226	Risk under industrial reuse scenario at the high end of the acceptable range.
Unrestricted	0 to 3	0.01	2.1×10^{-4}	--	--[3]	Radium 226	Unacceptable risk under unrestricted land use scenario

Notes:

[1] Cancer risk and HI for industrial scenario is adult exposure only, and unrestricted land-use scenario is the sum of child and adult exposures. In general, action is not warranted at a site when the cancer risk is less than 10^{-4} and HI is less than 1. The 10^{-6} risk level was used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure.

[2] 99th percentile data. The adult residential (unrestricted) blood-lead level is provided in the industrial scenario for comparison. The blood-lead level for adults in an industrial scenario would be lower. The child blood-lead level is provided in the unrestricted land-use scenario, because its level is higher (more restrictive) than the adult level. The target blood-lead level is less than 10 µg/dL.

[3] Lead is not chemical of concern at IRP Site 1.

bgs = below ground surface
HI = Hazard Index
µg/dL = micrograms per deciliter

Radium-226 contaminated soil was removed in 2004. The closure report is in preparation.

2.5.14.5 Analysis of Alternatives

In the location of the wash water spill, radium-226 has contaminated the soil at the surface to 3 feet bgs. Projected long-term reuse plans for Building 752 and the surrounding area are industrial/commercial-related uses, which is consistent with city of San Bernardino zoning. The industrial reuse risk is 4.7×10^{-5}, and the unrestricted reuse risk is 2.1×10^{-4}.

Alternative 1 (NFA) would not be protective under an unrestricted reuse scenario. In addition, the industrial risk is on the high end of the acceptable range. Radium-226 is persistent in the environment (greater than 2000 year half-life).

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing limitations on land use that "run with the land." The ICs would prohibit unrestricted reuse of the site, notify others about the presence of soils contamination, restrict soil excavation and disposal, and allow access for inspection of ongoing land-use activities. The ICs would address the 0.2-acre area of affected soil. There are no short-term concerns with this alternative.

Alternative 3 (Containment) for the pipeline spill location, which would consist of the existing asphalt and concrete cover, would protect human health and the environment by providing a barrier to exposure. Long-term effectiveness could be ensured by ICs requiring maintenance of the containment system. Containment would not be applicable to the surface spill location because a minimum 2-foot cover probably would interfere with reuse plans for the building area. There are no ARARs applicable to the containment alternative.

Alternative 4 (Removal) would provide long-term effectiveness and permanence. Short-term impacts due to soil excavation would need to be managed. The alternative could be implemented to address excavation, transport, and disposal ARARs and could be completed in less than one week. Contaminant concentrations are not at levels that trigger land disposal treatment requirements, and there would be no treatment to reduce TMV.

Pothole removals were completed in 2004 along the former sewer line in order to meet a cleanup goal of 2 pCi/g. Also, radium-226 contaminated soil along the west side of the building was removed in 2004. All contaminated soil will be properly disposed. The closure report, which is in preparation, will include characterization of any remaining contaminant levels to demonstrate that Building 752 has been cleaned up to the acceptable risk range.

2.5.14.6 Description of the Selected Remedy

The selected remedy is excavation and disposal of soil containing radium-226 in excess of 2 pCi/g along the west side of the building. The excavated soil will be transported off base for disposal at a permitted facility. The closure report, which is in preparation, will include characterization of any remaining contaminant levels to demonstrate that Building 752 has been cleaned up to the acceptable risk range.

2.5.14.7 Summary of Rationale for the Selected Remedy

The Building 752 exterior sewer pipeline location was subject to a removal action involving excavation of the pipe and surrounding soils exhibiting radium-226 contamination. Projected long-term plans for the building are industrial/commercial-related uses, which is consistent with city of San Bernardino zoning. The excavation was backfilled with soil and covered by asphalt

and concrete pavement. Residual contamination at the site exists as three hot spots along the pipeline right-of-way. The only risk due to the site would occur if the cover were to be removed (combined child/adult excess cancer risk of 2.3×10^{-6}). This risk is driven by three hot-spot locations based on confirmation data collected following removal of the pipeline. The selected remedy for the pipeline excavation is pothole removal of three spots exceeding 2 pCi/g for radium-226 and off-site disposal of the soil.

The wash water spill location exhibits radium-226 contamination in an elongated area immediately west of Building 752. The combined child/adult cancer risk of 2.1×10^{-4} exceeds the risk management decision range; therefore, the selected remedy is excavation and removal of the soil contamination that extends to approximately 2 feet bgs, exceeding 2 pCi/g for radium-226.

The selected remedy is protective of human health and the environment through permanent removal of contaminated soil above unrestricted use levels. The excavated soil will be transported off base for disposal at a permitted facility. The excavation will be performed in a manner to address all ARARs for radioactive material handling, transport, and disposal. The decision is protective in the short-term through implementation of measures to prevent release of contaminants during waste handling and transport. The decision is protective in the long-term due to the reduction in wastes at the site. Soil contaminant concentrations are not sufficient to warrant treatment prior to disposal. The decision is readily implementable and will be cost-effective.

Pothole removals were completed in 2004 along the former sewer line in order to meet a cleanup goal of 2 pCi/g. Also, removal of the radium-226 contaminated soil on the west side of Building 752 was completed in 2004. The closure report is in preparation. All contaminated soil will be properly disposed.

2.5.14.8 Expected Outcome of Selected Remedy

Implementation of the selected remedy at Building 752 will allow for unrestricted reuse of the site. Pothole removals were completed in 2004 along the former sewer line in order to meet a cleanup goal of 2 pCi/g. Also, removal of the radium-226 contaminated soil on the west side of

the building was completed in 2004. The closure report is in preparation. All contaminated soil will be properly disposed.

2.5.15 NBA PCE Plume

2.5.15.1 Site History

The NBA has two PCE plumes, one in the eastern portion (east PCE plume) where the former Site 2 landfill is situated, and a smaller plume in the central portion (west PCE plume). Only the west PCE plume has been above the MCL for PCE since April 2003. The average gradient in the NBA has been observed to fluctuate between a low of 0.004 foot per foot (October 2003) and a high of 0.039 foot per foot (April 1996). Seasonal variation remains relatively constant.

The source of the contamination contributing to the NBA west PCE plume is not believed to be associated with IRP Site 2. PCE concentrations are higher in the west plume than those in the east plume, whereas they would be expected to be less due to contaminant dispersal. In addition, there are monitoring wells with no detectable PCE between the two plumes. During the CS and ESI, which involved sampling at buildings with a history of chemical usage, soil gas samples were collected at several building locations in the NBA in the vicinity of the west PCE plume. PCE was not detected in the soil gas samples at concentrations that could affect groundwater at 200 feet bgs.

The groundwater flow direction in the NBA is to the west to west-northwest. Groundwater quality data for the NBA plume wells do not indicate significant movement of the plumes, either horizontally or vertically. The decline in PCE concentrations is likely a result of natural attenuation of the plumes and the limited extent (area and concentration) of the PCE source. Analytical data show that PCE concentrations decrease rapidly with depth. The NBA PCE plume has been monitored for 12 years (48 consecutive quarters). Data from MW294, cross-gradient to the Site 2 landfill and north of the base suggest there may have been an off-site source for PCE that, at least in part, contributed to the NBA plumes.

PCE and TCE have been the most frequently detected chemicals in the samples collected from the 32 NBA groundwater monitoring wells, with less frequent detections of benzene, vinyl

chloride, trichloroethane, tichlorofluoromethane, and dichlorodifluoromethane. During the last 12 years of sampling, the PCE plume has been well defined; however, there have been sampling periods where PCE was at or over 5 µg/L. Detections of PCE at or above its MCL of 5 µg/L in the NBA plume wells have steadily declined since it was detected in samples collected from seven wells at a maximum of 18 µg/L in July 1992. PCE was not detected above the MCL in any NBA well except MW-113 since April 2003. NBA monitoring well MW-113 continues to fluctuate around the MCL. Table 2-22 summarizes the PCE data since 1992.

2.5.15.2 Current and Potential Future Site Use

The property overlying the NBA plume is zoned industrial/commercial by the city of San Bernardino. The projected long-term use for Site 2, which overlies the east plume, is expected to be passive open space or potentially a long-term, open storage area. The projected long-term use for the property over the west plume is industrial/commercial, possibly warehousing.

2.5.15.3 Summary of Site Risk

The BWFS concluded NFA for this site as data collected over the past 12 years indicate that PCE concentrations are at or below the MCL (5 µg/L), with an overall trend of decreasing concentrations.

2.5.15.4 Remedial Action Objectives

There are no RAOs for the NBA PCE Plume since there is un unacceptable risk to human health or the environment.

2.5.15.5 Analysis of Alternatives

PCE contamination has been decreasing, probably due to natural attenuation, since first monitored in 1992 and is at or below the MCL of 5 µg/L.

Alternative 1 (NFA) is potentially not protective of human health and the environment under the residential reuse scenario. The land is zoned for industrial/commercial uses, and the proposed master plan for the area identifies the site for industrial buildings. Current land use in the eastern portion of the NBA is open space (Site 2 closed landfill). Current land use in the western portion

Table 2-22

of the NBA is industrial/commercial-related projects. Projected long-term reuse for the entire NBA is for industrial/commercial-related projects. However, NFA would fail to provide adequate assurance of long-term effectiveness and permanence under an unrestricted reuse scenario.

Alternative 2 (ICs) addresses long-term effectiveness and protection of human health by providing for limitations on land use that "run with the land." Alternative 2 coupled with long-term groundwater monitoring, would prohibit groundwater extraction other than for groundwater monitoring beneath the property, and allow access to inspect ongoing land-use activities. There are no short-term concerns with this alternative.

2.5.15.6 Description of the Selected Remedy

- The selected remedy for the NBA PCE Plume is NFA.

2.5.15.7 Summary of Rationale for the Selected Remedy

The NBA plume has been monitored for 12 years (48 consecutive quarters) since 1992 and the PCE in the plume is at or below the MCL. One well (MW-113) fluctuates around the MCL. The current use of the property overlying the east plume is a closed landfill and projected long-term use of the site is expected to be passive open space. Currently the NBA property is not used and projected use is for commercial/industrial, possibly warehousing.

2.5.15.8 Expected Outcome of the Selected Remedy

The selected remedy will allow for unrestricted land use of the NBA plume property.

3.0 OTHER CONSIDERATIONS

3.1 PRINCIPAL THREAT WASTE

The NCP establishes principal threat wastes as source materials considered highly toxic or highly mobile that generally cannot be reliably contained or would present a significant risk to human health or the environment should exposure occur. Soil contamination generally considered to present a principal threat poses a potential risk several orders of magnitude greater than the risk level acceptable for the current or reasonably anticipated future land use (U.S. EPA, 1997b). Principal threat wastes at the former Norton AFB have been addressed through prior removal actions. No principal threat wastes are present at the former Norton AFB.

3.2 STATUTORY DETERMINATIONS

Per the statutory requirements of CERCLA Section 121, the selected remedies will adequately protect human health and the environment, will comply with ARARs, and are cost effective. The selected remedies do not utilize treatment as a principal element since treatment would not be cost-effective. The selected remedies will result in the following:

- Existing or potential risks posed by the sites through each pathway will be eliminated, reduced, or controlled by the response action.
- Exposure levels will be reduced to protective ARAR levels or to within U.S. EPA's risk management range of 10^{-4} to 10^{-6} for carcinogenic risk and below the hazard index of 1.0 for noncarcinogens.
- Implementation of the selected remedies will not pose unacceptable short-term risks or cross-media impacts.
- The remedies provide adequate protection of the environment.

ARARs and requirements of the 5-year review process are described in the following subsections.

3.2.1 Applicable or Relevant and Appropriate Requirements

A CERCLA remedy must meet ARARs unless a waiver to the specific requirement is sought and approved by the U.S. EPA. An ARAR is a promulgated and enforceable federal standard, regulation, criteria, or limitation stated in a law or regulatory code. A relevant State law or regulation can also be considered as an ARAR if the state law or regulation is more stringent than its existing federal counterpart. ARARs, therefore, provide legal direction and control of the remedial activity. *Applicable* requirements are standards or regulations that specifically address the contaminant (chemical) or site situation by statute or code. *Relevant and appropriate* requirements reflect standards or regulations that were not originally written for the site situation, but because the site situation is sufficiently similar to the intent of the requirement, the requirement can be used to direct and control the remedial activity.

In addition to ARARs, CERCLA allows the consideration of To-Be-Considered (TBC) criteria for the establishment of standards to direct and control a remedial activity when no ARAR exists. TBCs can include risk-based criteria, advisories, and guidance that were not promulgated and may have been originally developed for risk management decisions. For example, there are very few promulgated standards for cleanup of contaminated soil. Soil cleanup standards are generally risk-based values that are developed as an outcome from the risk assessment process.

There are three general categories of ARARs: chemical-, location-, and action-specific. Chemical-specific ARARs establish numerical values for allowable concentrations of substances that may remain in, or be discharged to, the medium of concern, or a medium affected by the RA. MCLs for drinking water and contaminant treatment standards are considered chemical-specific ARARs. For contaminants or media that do not have a promulgated standard (e.g., metals contaminated soils), TBC criteria may be evaluated for use in defining chemical-specific cleanup standards.

Location-specific ARARs are generally restrictions placed upon the concentration of a substance or the conduct of certain activities solely because they are in specific locations. The siting of landfills or treatment units is an example of a location-specific ARAR. TBC siting criteria could relate to the proximity of a site to endangered species habitat.

Action-specific ARARs are typically technology- or activity-based requirements or limitations taken with respect to specific substances or requirements to conduct certain actions to address particular circumstances at a site. Limitations on waste treatment (e.g., air stripping towers, incinerators) are examples of action-specific ARARs. These ARARs include performance and design standards. TBC action-specific criteria could relate to the reduction of truck traffic during a southern California smog alert advisory to reduce the impact to air quality.

The federal and state ARARs pertaining to the selected remedies presented in this ROD are presented in Tables 3-1 through 3-3.

3.2.2 Five-Year Review

In compliance with CERCLA requirements, a 5-year review process has been developed to assess the effectiveness of remedial actions undertaken at the former Norton AFB. The goal of the review is to confirm that the selected RAs comply with performance standards established in the former Norton AFB ROD, cleanup goals are being achieved in accordance with the selected remedy, and that the selected RAs continue to be protective of human health and the environment. Representatives from the DTSC, the RWQCB, the U.S. EPA, and the Air Force participate in this review process.

The initial review for the former Norton AFB CBA OU was conducted in 1999, and the next review is scheduled for 2005.

3.3 DOCUMENTATION OF SIGNIFICANT CHANGES

The BWPP was submitted to the public for review on July 28, 2004, and a public hearing was held at the San Bernardino City Council Chambers on August 11, 2004. Public comments were received and are provided in the Responsiveness Summary in Section 4. The selected remedies are consistent with the preferred remedial alternatives designated in the BWPP.

Table 3-1

Applicable or Relevant and Appropriate Requirements for Excavation Sites

Requirement	Citation	Scope	Comment	Applicable Site
Federal ARARs				
Endangered Species Act	16 USC §§1531 40 CFR §6.302(H) 50 CFR Part 12	Requires action to conserve endangered species within critical habitat	**Applicable** to any action affecting welfare of the San Bernardino Merriam's kangaroo rat and the Santa Ana River woolly star.	IRP Site 10
State of California ARARs				
California Endangered Species Act	California Fish and Game Code #2050-2098	Provides for the conservation and protection of endangered species and their habitats	**Applicable** to the protection of the Santa Ana River woolly star, a state listed species.	IRP Site 10
Criteria for Identifying Hazardous Waste/Persistent and Bioaccumulative Toxic Substances	CCR Title 22, Div. 4.5, Chapter 11, §66261, et seq.	Provides criteria and tests for identifying hazardous waste. If a chemical is either listed or tested and found hazardous, then disposal must comply with Title 22 hazardous waste requirements regarding how the chemical is to be handled, treated, and disposed.	**Applicable** to the characterization of contaminated soils for off-site disposal in a permitted facility.	IRP Sites 7, 10, 17, AOCs 33, Building 752
Standards Applicable to Generators of Hazardous Waste	CCR Title 22, Div. 4.5, Chapter 12, §§66262, et seq.	Establishes requirements for generators of hazardous waste, includes regulations for accumulation of waste and manifests and reporting requirements. Relates to the requirements for maintaining documented records of generation and disposal of hazardous substances.	**Applicable** to excavated soil that meets state hazardous waste criteria.	IRP Sites 7, 10, 17, AOCs 33, Building 752
Standards Applicable to Transporters of Hazardous Waste	CCR Title 22, Div. 4.5, Ch. 11, §§66263.10-66263.17	Establishes standards for transporters of hazardous waste including compliance with manifest systems and record keeping.	**Applicable** for off-site transportation of hazardous waste.	IRP Sites 7, 10, 17, AOCs 33, Building 752
Land Disposal Restrictions	CCR Title 22, Div. 4.5, Chapter 18, §66268 et. seq.	Provides regulations that establish concentration limits and treatment criteria for the land disposal of hazardous waste.	**Applicable to excavated soil exceeding threshold levels requiring treatment prior to disposal at a permitted facility.**	IRP Sites 7, 10, 17, AOCs 33, Building 752

Table 3-1

Applicable or Relevant and Appropriate Requirements for Excavation Sites

Requirement	Citation	Scope	Comment	Applicable Site
South Coast Air Quality Management District Rules	Rule 403	Fugitive Dust. Limits on-site activities so that the concentration of fugitive dust at the property line will not be visible and the downwind particulate concentration will not be more than 100 micrograms per cubic meter, averaged over 5 hours, above the upwind particulate concentration.	**Applicable** to excavation of contaminated soils	IRP Sites 7, 10, 17, AOCs 33, Building 752
South Coast Air Quality Management District Rules	Rule 404	Particulate Matter (Concentration). Rule 404 (1) limits particulate emission to a range of 0.010 to 0.196 grain per standard cubic foot averaged over 1 hour for a volumetric gas flow rate of 7,000 cubic meters per hour to 23 cubic meters per hour, respectively.	**Applicable** to excavation of contaminated soils.	IRP Sites 7, 10, 17, AOCs 33, Building 752

4.0 RESPONSIVENESS SUMMARY

PUBLIC COMMENTS ON THE BASEWIDE PROPOSED PLAN

Comments and responses are summarized below. Only one comment from the public was received during the public meeting held on August 11, 2004, or during the comment period from July 28 through September 10, 2004.

Comment: I'd just like to express appreciation of the agencies. As many of you know, when the base was closed it was leased and turned over to Inland Valley Development Agency and San Bernardino International Airport Authority, and that was in 1994 and 1995. And I've been here since 1998 working with all of these folks on this process, and there's a couple of things I want to mention.

There's Phil, EPA, State of California, and many others in the room who worked on this, and what's really important frankly is getting this cleanup approval and getting the title to the property because title to the property allows us to go into redevelopment.

And, in fact, we have a representative from Hillwood here tonight. They've been putting in some very modern and up-scale buildings into this project, which is a tremendous development for the community, adding jobs and so forth. So it's been a long road but I think, as Phil said too, we've been fortunate that the cleanup has gone very well.

A lot of money has been spent too. I don't know the number. Phil can maybe give us that number, but it's not just a lot of time. It's a lot of money. So tonight is really a milestone because as we finish the record of decision, we will shortly own all the property and will be in the full redevelopment program.

So again, thanks to you all. I've enjoyed working with you. I've spent about six to seven years myself that I've been here, and we've made an awful lot of progress. So thank you for the opportunity to comment.

Air Force Response: I did write down those numbers. Overall to date to the end of fiscal year (FY) 2004, $133 million. FY04 to completion, the estimated cost, $8.5 million. For the selected alternatives that we discussed, their estimated cost is around $3.4 million. These estimates are that, they're estimates. Hopefully there's still some cost savings. There isn't cost savings on the $133 million; that's already spent. As we go through to completion, hopefully we can spend less taxpayer dollars on the $8.5 million that we have estimated to complete.

REPORTER'S TRANSCRIPT OF PROCEEDINGS

BASEWIDE OPERABLE UNIT PROPOSED PLAN

PUBLIC MEETING

SAN BERNARDINO CITY COUNCIL CHAMBERS

300 NORTH D STREET, SAN BERNARDINO, CALIFORNIA

AUGUST 11, 2004, 6:30 P.M.

Reported by Kelly Paulson, CSR No. 8295

SAN BERNARDINO, CALIFORNIA, AUGUST 11TH, 2004

* * *

MR. CHANG: Thank you, Phil. I'm James Chang. I'm the project manager from EPA and, you know, if you guys realized some of the things that Phil has shared, you might have also wondered, golly, you know, if the site had become -- or when the site was on the NPL list since 1987, why did it take us so long.

Well, you know, you can see that the CERCLA process, even though it's very cumbersome, it's a very methodical process. Phil kind of walked you through some of that already, you know, how he's had to do the investigation, then followed by the feasibility study, then by the ROD, and then, of course, the removals.

So it is a very methodical process that EPA ensures that it's followed closely, and the reason why we do that, of course, is to protect the public. And this is probably what I would consider the CERCLA process at its best because in addition to what Phil has done to be sure that the remedies are protective, CERCLA also ensures that the public is well informed.

So at this time I just want to thank Phil and the two Linda's here who have put this presentation together because it is very important that the public

understands what has been done.

And I'd also like to follow up on what Phil said a little bit about Norton being a good news story, and I truly agree with that. As you can see, you know, Phil shared a little bit about the pump and treat system. The pump and treat system from an EPA perspective is probably one of the most difficult remedies to implement, and I think the Air Force here has done an exceptional job.

I would consider Norton probably being one of the best in the nation I've seen, and I'm glad to say that we're very near closure to that. And with the baseline ROD coming up, you know, I'm looking forward to signing that ROD from the EPA perspective, you know, based upon, of course, the type of comments we get from the public, but Phil has shared and EPA does agree that what has been written in the ROD, which you guys have a chance to comment on, we agree with the remedy selected. We feel that they are protective and it will support reuse and, of course, that's really the bottom line is that, you know, we can get this land transferred working with the Air Force so that the public can have its beneficial use.

So I just wanted to also thank Phil for what he's done from the Air Force perspective where, you

know, since '87 we've had a lot of tough decisions, and some of these remedies you see, you know, we just didn't pull them out of the air. You know, some of these decisions have been hashed and rehashed three, four, five, six, seven times until we've come to where we are today.

So they are very tough methodical, you know, thought-through decisions, and it's been a long time coming. So I just want to thank the State and the Air Force for coming along in the CERCLA process with that. So thank you for being mere.

MR. MOOK: I had one thing before I turned it over to clarifying questions. I had it written here and I missed it, but I want to talk about schedule for the ROD. It was our intention to sign this ROD before the end of our fiscal year which was -- which is 30 September.

A couple of things have happened. One of them is we've extended the public comment period to 10 September. If we were to get, you know, some really salient hard-hitting comments that took, you know, review and decision making, that could affect the 30 September.

There is another issue that doesn't deal with the remedy that could slow down the ROD, and it's one

that DTSC, the State of California, and then my managers back in Washington D.C. are working, you know, at this higher level about the reimbursement of state costs after the record of decision is signed.

So a site like Site 2, the landfill, that has waste in place after the ROD is signed and there is an ongoing remedy and there are institutional controls and there's state land use covenants and there's deed restrictions and stuff, DTSC wants/needs to stay involved during that, and their involvement needs to be paid for. The disagreement right now is who is going to pay for that and how it's going to be paid for.

So we can go forward with our remedies. We can be protective of human health and the environment for a considerable period of time while the State and the Air Force work out the mechanism for reimbursement of their direct costs for oversight of our site. The right people are involved. The decision makers are involved. So it shouldn't take too long for these guys to -- it shouldn't take too long for these guys to make the resolution.

They're supposed to talk again, I think, on the 16th of August, next week, and maybe something substantial and permanent will come out of that teleconference, but that is another thing that might

slow us down a little bit here. We will not sign the ROD until that is resolved. So that's the schedule, and with that I'll turn it back to Linda if there's questions.

MS. GEISSINGER: Yes. This is the Q and A part of it. So if there's something that you didn't understand that you'd like more clarification on, if Phil used too many acronyms, you want to know what ROD and CERCLA stands for, this is the time to ask those questions. It is not the public comment time.

Does anybody have any questions?

MR. CATOE: I do have one question. In regards to the one site that was exposed to Radium 226 and the plan to excavate to an off-site disposal site, you stated that site was in Utah and Wyoming, was it?

MR. MOOK: The question -- I think everybody heard it, but I'll just try and restate it for my own good -- was where is the soil from the radium paint facility removal action, where will it be in turn. And the two facilities, I think there's only two that are in the Western United States this side of the Mississippi, there's one in Utah, EnviroCare, and then there's one in Idaho.

So those are the two places, and they are licensed by the NRC regulatory commission, Nuclear

Regulatory Commission, to have this kind of waste, and then they would be placed in a cell or an area and monitored. Radium has a very long half life. It doesn't actually decay, but it takes about 2,000 years to go one half of its contamination. They figure to go to zero, to approach zero, it has to do five half lives. So that's like 10,000 years.

And you know from the news and things that are going on, radionuclei disposal is a big issue and this -- our side is just not -- compared to, you know, some of the stuff they're talking about at DOE sites and, you know, the nuclear testing facilities and stuff, we just have a little bit of naturally occurring radium that's been concentrated.

MR. CATOE: Well, my main question was basically how was it transported.

MR. MOOK: Yes. Well, we have a transportation plan. The soil is put into a specially designed box. It's a covered lid. It's not, you know, dumped into an open truck or anything like that. It's put into -- they're called B-25 boxes. They're sealed up. They're taken to a staging area. The whole exterior of the box is scanned.

Radium is an alpha emitter. That's the particle that it emits, and it is stopped by almost any

physical barrier. A piece of paper can actually shield the radium paint or the alpha particle. What happens if somebody ingests it and it gets stuck in your lungs or like the ladies who used the paint and they'd lick their paintbrushes, it can be very bad. But if there's any kind of clothing or anything, it's fine.

So they put it in a box. They take it to an area. They scan all around the box and make sure that there's no loose material on the outside of it, and then it's shipped off by a truck to one of those two facilities.

MS. GEISSINGER: Any other questions?

MR. ROBERTS: Was there any evolution of technology in going through this clean-up? Did you learn anything new that you can use?

MR. MOOK: Well, yes, and not so much about the decisions that we're making tonight, not so much about the Basewide ROD as we did on the soil vapor extraction and the pump and treat systems that were installed for the central base unit.

You know, we made a lot of -- we were able to do a much better job cleaning up at Norton than is typical for other sites around the country, and it mainly is the luck of the draw or heredity or whatever that Norton Air Force Base has the right type of geology

that lends itself for pump and treat and vapor extraction.

We also did a lot of investigations, and we were able to enhance or do ways of investigating, both radionuclei investigation and other investigations to help save money, that then can be used for cleanup rather than, you know, the characterization of the site.

And I guess the final one that I'd like to say that was an enhancement or whatever for the process is we used removal actions extensively. We went in there early, determined we had an issue, and got it taken care of, and that both saved money and reduced the risk to human health and the environment, and it let the property get into reuse quicker.

So we had a real good team, like you heard from James and EPA and the State, working together for this common goal of getting the place cleaned up as quickly as possible. Even though we're talking about 1982, we did a lot of work and, you know, turned over a lot of property.

MS. GEISSINGER: Any other questions? All right. This is the point at which we ask for official on-the-record public comments, and if you're interested in making a comment, written responses will be made available in the responsiveness summary which is

a supplement to the record of decision.

So it does become a public document, and it is part of the administrative record for Norton. If you don't want to make a verbal public comment, again, you have until September 10th to fill out one of these and send it to us in writing.

Anybody? Any comments? Jim, you always have something to say.

MR. GOURLEY: Sure, I'll make a comment, as long as I don't have to go down to the microphone.

MS. GEISSINGER: Okay. Just if you could spell your name for the court reporter.

MR. GOURLEY: Yeah. It's Jim Gourley, G-o-u-r-l-e-y, and I'd just like to express appreciation of the agencies. As many of you know, when the base was closed it was leased and turned over to Inland Valley Loan Agency and San Bernardino International Airport Authority, and that was in 1994 and 1995. And I've been here since 1998 working with all of these folks on this process, and there's a couple things I want to mention.

There's Phil, EPA, State of California, and many others in the room who worked on this, and what's really important frankly is getting this cleanup approval and getting the title to the property because title to the property allows us to go into

redevelopment.

And, in fact, we have a representative from (inaudible) here tonight. They've been putting in some very modern and up-scale buildings into this project which is a tremendous development for the community, adding jobs and so forth. So it's been a long road, but I think as Phil said too, we've been very fortunate that the cleanup has gone very well.

A lot of money has been spent too. I don't know the number, and I don't know if anybody in the room knows the number. Phil can maybe give us that number, but it's not just a lot of time. It's a lot of money. So what we're doing here tonight is really a milestone because as these comments come in and we finish the record of decision, we then frankly will shortly own all the property and will be in the full development or redevelopment program.

So again, thanks to you all. I've enjoyed working with you. I've spent about six to seven years myself that I've been here, and we've made an awful lot of progress. So thank you for the opportunity to comment.

MS. GEISSINGER: You're welcome. Thank you.

MR. MOOK: I did write down those numbers. Overall to date to the end of fiscal year '04,

$133 million. FY '04 to completion, the estimate cost, $8.5 million. The selected alternatives that we discussed up here, their estimated cost is around $3.4 million once you kind of round off. These estimates are that, they're estimates. So I could say $3,396,000, but that would be accuracy that I don't have.

So 3.4 is plenty accurate, and hopefully there's still some cost savings. There isn't a cost savings on the $133 million that's already spent, but as we go through to completion, hopefully we can, you know, spend less taxpayer dollars on the eight and a half million that we have estimated to complete.

MS. GEISSINGER: Anyone else? Comments? No. Okay. Well, thank you very much for coming, and again, if you have second thoughts or want to put your comments in writing, we would appreciate those as well.

Thank you, Phil. Thank you very much.

(Meeting adjourned)
